

# BEARINGS

GENERAL  
catalogue

**OFFICIAL DISTRIBUTOR**

*“As a boy I had a dream - to build mechanisms that would help people in their daily lives. Then, one day, I realized that my dream had come true and my gears were making ideas happen worldwide.”*

*Silvio Chiaravalli  
Founder of the company  
Chiaravalli Group SpA*

# 60 YEARS OF HISTORY

The goal pursued by Chiaravalli during more than 60 years of history is to become the Italian and European technological center of excellence in the field of mechanical transmission.

# The Manufacturer DISTRIBUTOR

Our Logistic Center in Cantalupa is a coordinated mix of informatic functions intended for storage, picking, packaging and delivery of products.

All the functions have been automated at the highest levels available today.

The Chiaravalli logistic group has established itself over the years becoming an example of excellence for all the European companies working in the same sector.

WE MANUFACTURE

## SPECIAL COMPONENTS

Production of special components with high complexity and extremely high precision

## MECHANICAL WORM SCREW JACKS

Customized and Standard products as per our catalogue

## STANDARD TRANSMISSION

Standard products as per our catalogue

WE DISTRIBUTE

## URB BEARINGS

## BELTS

## GEAR BOXES & ELECTRIC MOTORS

## Measuring units of the international system SI

### Length

1 mm = 0,039 in

1 in = 25,4 mm

### Mass

1 kg = 2,205 lb

### Force

1 kN = 1 000 N = 225 lbf

1 kgf = 9,81 N

1 lbf = 4,45 N

### Moment

1 N mm = 0,102 kgf mm

1 kgf mm = 9,81 N mm

1 N m = 8,85 in lbf

1 in lbf = 0,113 N mm

4

### Pressure per unit of area (surface)

1 N/mm<sup>2</sup> = 1 MPa = 145 psi

1 psi = 0,102 kgf/mm<sup>2</sup>

1 kgf/mm<sup>2</sup> = 9,81 N/mm<sup>2</sup>

### Power

1 W = 1 J/s = 1 N m/s = 0,102 kgf m/s

1 kW = 1,36 CP = 102 kgf m/s

1 kgf m/s = 9,81 N m/s = 9,81 j/s

### Mechanical work

1 kgf m = 9,81 W s = 9,81 N m

1 J (Joule) = 1 N m = 1 W s = 0,102 kgf m

### Kinematic viscosity

1 mm<sup>2</sup>/s = 1 cSt (centiStokes)

## Selection of bearing type

Each type of bearing displays characteristics features which make it suitable for a certain application. Therefore, many bearings types and constructive versions have been developed so that they can satisfy various demands for rolling bearings. No general rule can be given, taking into account the great number of factors to be considered when selecting a bearing type.

We give further the most important criteria to be considered when selecting the bearing type.

### Selection of bearing type, considering the load magnitude and direction

#### Radial load

Deep groove ball bearings are the most suitable types of bearings for light and moderate pure radial loads. For heavy radial load and where large-diameter shafts are used, double row cylindrical roller bearings are the adequate choice.

#### Axial load

For pure axial loads, single direction thrust ball bearings are used in case of loads acting in one directions. For loads acting in both directions, double direction thrust ball bearings are used. Angular contact thrust ball bearing and single or double row angular contact ball bearings, are used in case of light or moderate pure axial loads at moderate speeds.

For light axial loads at high speeds, deep groove ball bearings are suitable. Under the axial load, a contact angle different from  $0^\circ$  is generated in these bearings and therefore they operate as angular contact ball bearings.

In order to increase axial load carrying capacity, a larger clearance should be selected (C3, C4). For moderate axial loads at high speed, angular contact

ball bearings in tandem arrangement are used so that they can take over loads acting in both directions.

#### Combined load

In order to carry combined radial and axial loads acting simultaneously, bearings with a contact angle different from  $0^\circ$  are used. The greater the contact angle, the greater the axial load carrying capacity.

Self-aligning ball bearings, spherical roller bearings or cylindrical roller bearings (NJ, NUP, NJ + HJ types), can also accommodate combined loads of certain values. But there are some limit values of the ratio  $F_a/F_r$ , which are shown in bearing tables and cannot be exceeded. Cylindrical roller bearings can carry axial loads by means of the sliding friction on ribs. For this reason, the load is limited according to the indications on pages 158, 159.

Bearings which accommodate only one direction axial loads should always be mounted in pairs so that they can carry axial loads in both directions.

### Selection of bearing type considering the alignment between shaft and housing

Angular misalignments occur generally when the shaft bends under the operating load or when bearings joint parts have deviations of form or position.

In such cases, self-aligning ball bearings, spherical roller bearings or spherical roller thrust bearings should be used.

A certain bearing bending angle which can compensate for errors of alignment and maximum angle values are shown for each type in the introductory texts of the table sections.

When misalignments should be compensated, radial and axial clearance are important. The larger the clearance, the greater the possibility of self-aligning.

If the misalignment exceeds the permissible values shown in the introductory texts of the bearing tables, the bearing rating life decreases. The greater the ratio  $Fr/C_{0r}$ , the shorter the rating life. If  $0,1 < Fr/C_{0r} < 3$ , the rating life decreases with about 25%.

## Selection of bearing type considering the operating temperature

Bearings are generally used up to a temperature of maximum +120°C. In case of higher temperatures, bearings with special heat treatments should be used, in accordance with specifications on page 23. Sealed bearings, 2RS type, should be used at operating temperatures up to 80°C. If this temperature is exceeded, the efficiency of lubricants is considerably reduced.

## Selection of bearing internal clearance

In most cases, while operating, bearings should have a small radial clearance that can be defined as “the possible value of displacement in radial direction of one bearing ring in relation to the other without parts deformations”.

While operating, bearing internal clearance is different from the one at delivery, since the latter is reduced when mounting bearings with a certain tight fit.

Under operating conditions, internal clearance change is also caused by different temperatures between the outer and inner ring. Bearings are generally delivered with a normal radial or axial clearance according to the values shown for each rolling bearing group.

The decrease in radial clearance due to the tight fit and operating temperature is considered to be between 60-80% of the tightening value, depending on bearing series and size.

After the clearance in bearings has been decreased, a large enough operational clearance should remain, so that the lubricant film shouldn't be destroyed.

Deep groove ball bearings should have an operational clearance close to zero. There may be often a light preload, due to the point-contact between the rolling elements and raceways.

Small-sized cylindrical roller bearings should have an operational clearance of 5-10 μm and larger-sized bearings a clearance of 10-30 μm.

Bearings can also be manufactured - at request - with radial and axial clearance smaller (C1 and C2) or larger (C3, C4 and C5) than normal, so that the most favorable operating conditions for bearings should be assured.

Cylindrical roller bearings can be manufactured with non-interchangeable rings (suffix NA).

Bearings with non-interchangeable parts have a different radial clearance than bearings with interchangeable parts. Changing rings from one bearing to another is not allowed.

In case of bearings with interchangeable parts, rings may be changed and the values of radial clearance will not be altered.

## Bearing types and technical characteristics

URB bearings can be manufactured in various type and size, so that they can meet the customers' requirements assuring a proper reliability for various applications.

Table 1.1 shows suitability of each group of bearings, considering the main technical characteristics.

Bearing type is selected depending on the technical characteristics required by a certain application.

A suggestive graphic symbol has been determined for each main technical characteristic. Thus, a proper bearing for each purpose can be easily chosen. According to the specifications in this catalogue, the proper type and size of bearing can be selected, together with all manufacturing and operating technical conditions.

### Bearing types and their characteristics

		Purely radial load	Purely axial load	Combined load	Moment load
Deep groove ball bearings					
Self-aligning ball bearings					
Angular contact ball bearings - single row					
- high precision					
- double rows					
Cylindrical roller bearings - NU; N					
- NJ, NU+HJ, NUP, NJ+HJ					
- NCF, NJ23VH					
- NNU, NN					
Spherical roller bearings					
Tapered roller bearings - single row					
Thrust ball bearing - single direction - double direction					

Table 1.1

Tolerance class	Quiet running	High speed	High stiffness	Compensation of misalignment	Low friction	Shock resistance	Located bearing	Non-located bearing	Axial displacement possible in bearing

## Selection of bearing size

The size of a bearing is selected considering as usually factor magnitude of the load, and also selection depends on the operational rating life and prescribed operating safety.

### Basic load ratings

The basic dynamic load rating  $C_r$  is used to evaluate bearing dimensions while rotating under load. It expresses the bearing admissible load which will give a basic rating life up to 1 000 000 revolutions.

The basic dynamic load ratings of URB bearings have been determined in accordance with international standard ISO 281. The values are given in bearing tables.

Considering the basic dynamic load rating, can be calculated the service time until the "metal fatigue" of rolling contact surfaces appears, determining this way the rating life.

The other characteristic, basic static load rating  $C_{or}$ , is considered in case of low speeds, low oscillating movements or in the stationary case.

The basic static load rating is defined in accordance with ISO 76, as the load acting upon the stationary bearing. It corresponds to a calculated contact stress in the center of the contact area between the most heavily loaded rolling element and the raceway, of:

- 4 600 MPa for self-aligning ball bearings,
- 4 200 MPa for all other ball bearings,
- 4 000 MPa for all roller bearings.

This stress produces a permanent deformations of the rolling element and raceway which is about 0,0001 of the rolling element diameter. The loads are pure radial for radial bearings and pure axial for thrust bearings.

### Bearing life

The life of a rolling bearing is defined as the number of revolutions or the number of operating hours, which the bearing is capable to endure, before

the first sign of metal fatigue occurs on one of its rings, on the raceway or the rolling elements.

If we want to consider only the fatigue of the bearing operating surfaces the following conditions have to be observed:

1. The forces and speeds considered when calculating the bearing should correspond to the real operating conditions.
2. Proper lubrication should be assured during the entire operating period.
3. If the bearing carries a light load, its failure is generated by wear.
4. Experience showed that the failure of many bearings was caused by other reasons than fatigue, such as: selection of an inadequate bearing type in a bearing assembly, improper operating conditions, lubrication contamination, etc.

### Basic rating life

The basic rating life of a single bearing or a group of apparently identical bearings operating under identical conditions, is the life corresponding to a reliability of 90%.

Basic rating life is marked with  $L_{10}$  (millions of revolutions) or  $L_{10h}$  (operating hours).

$L_{10}$  can be calculated using the equation:

$$L_{10} = \left( \frac{C}{P} \right)^p, \text{ where:}$$

- $L_{10}$  - basic rating life, millions of revolutions,
- $C$  - basic dynamic load rating, kN,
- $P$  - equivalent dynamic bearing load, kN,
- $p$  - exponent of the life equation
- $p = 3$  - for ball bearings
- $p = 10/3$  - for roller bearings

The equivalent dynamic bearing load, respectively the radial and axial load, acting simultaneously can be calculated using the following equations (applicable to ball and roller radial bearings):

$$P_r = F_r, \text{ kN,} \quad \text{- for pure radial load}$$

$$P_r = XF_r + YF_a, \text{ kN,} \quad \text{- for combined load}$$

For thrust ball bearings, the following equations can be used:

$$P_a = F_a, \text{ kN,} \quad \text{- for pure axial load}$$

$$P_a = XF_r + YF_a, \text{ kN,} \quad \text{- for combined load}$$

where:

$F_r$  = the radial component of the load, kN  
 $F_a$  = the axial component of the load, kN

In the texts preceding the bearing tables, for some groups of bearings there are given details for determining the equivalent load. Values of the coefficients X and Y can be found in tables.

For bearings operating at constant speed, the basic rating life expressed in operating hours can be calculated using the equation:

$$L_{10h} = \frac{1000000}{60n} \left(\frac{C}{P}\right)^p \quad \text{or} \quad L_{10h} = \frac{16666}{n} \left(\frac{C}{P}\right)^p$$

Where:

$n$  = rotational speed, r/min

Values of the basic rating life  $L_{10}$  (millions of revolutions) as a function of the ratio C/P can be found in the table 2.1.

Values of the basic rating life  $L_{10h}$  (operating hours) as a function of the ratio C/P and speed  $n$  can be found in table 2.2 for ball bearings and table 2.3 for roller bearings.

When determining the bearing size it is necessary to base the calculations on the rating life corresponding to the purpose of operation.

Usually it depends on the machine type, service life and the requirements regarding operational safety.

Approximate values of the service life for various classes of machines and equipments for general purposes are given in table 2.4.

The basic rating life  $L_{10h}$  of the bearings can be determined as a function of service life, using the life

calculation chart on page 17.

The basic rating life of road and rail vehicle bearings, for axlebox bearings, is expressed as a function of the wheel diameter and covered distance (km), using the equation:

$$L_{10s} = \frac{\pi D}{1000} L_{10}$$

where:

$L_{10}$  - basic rating life, millions of revolutions  
 $L_{10s}$  - service life distance, millions of kilometers  
 $D$  - wheel diameter, metres

Approximate values for the service life distance (kilometers covered), in case of light loaded cars and rail vehicles are given in table 2.5.

**Load ratio C/P for various life L10 (milions of revolutions)**

**Example:**

1. Determine the size of a deep groove ball bearing single row, considering the following conditions:

- Basic rating life  $L_{10h} = 25000$  operating hours
- Rotational speed  $n = 1000$  rpm
- Radial load  $F_r = P = 5$  kN

In the chart we find report:  $C/P = 11,6$ ;  $C = 11,6 \times P = 11,6 \times 5 = 58$  kN. In the catalogue on page 100, you can select bearing 6310 type, with the following characteristics:  $C_r = 61,8$  kN;  $n_{lim} = 7000$  rpm.

2. What is the basic life of the bearing NU 210E, operating under radial load of 7,7 kN, at a rotational speed  $n = 750$  rpm?

See page 172 in the catalogue and find for NU 210E type, the following values:  $C_r = 64,4$  kN,  $n_{lim} = 8000$  rpm. From the chart, for a roller bearing operated at 750 rpm, and  $C_r/P_r = 64,4/7,7 = 8,36$  result is a rating life  $L_{10h} = 25000$  hours.

Recommended basic rating lives for general purpose machines	
	Table 2.4
Application	Recommended basic rating life $L_{10h}$ (operating hours)
Household machines, technical apparatus for medical use, instruments, agricultural machines:	300..3000
Machines used for short periods or intermittently: electric hand tools, cranes, lifting tackles in workshops, building machines:	3000..8000
Machines used intermittently or for short periods with high operational reliability: lifts, small cranes	8000..12000
Machines for use 8 hours/day but not always at full capacity: machines for general purposes, electric motors for industrial use, rotary crushers, gear drives for general purposes:	10000..25000
Machines operating 8 hours/day at full capacity: machine tools, woodworking machines, large cranes, printing equipment, ventilators, separators, centrifuges:	20000..30000
Machines for continuous use 24 hours/day: Rolling mill gear units, medium sized electrical machinery, compressors, pumps, textile machines, mine hoists:	40000..50000
Hydraulic machines, rotary furnaces, capstans, propulsion machinery for sea vessel (propellers for sea vessels):	50000..100000
Machines for continuous use 24 hour/day with high reliability: large electric machinery, mine pumps and mine ventilators, power station plants, machines for cellulose industry, pumping units:	100000..

Values for basic rating life $L_{10s}$	
	Table 2.5
Type of vehicle	$L_{10s}/10^6$ [km]
Wheel hub bearings automotive:	
- light loaded cars	0,3
- trucks, buses	0,6
Axlebox bearings rail vehicles:	
- freight wagons (according to UIC)	0,8
- suburban vehicles, trams	1,5
- long distance passenger carriages	3
- motorailers	3...4
- Diesel and electric locomotives	3...4

In case of bearings which do not rotate, but oscillates from a central position through an angle, as shown in fig. 1, basic rating life can be determined as follows:

$$L_{10osc} = \frac{180}{2\gamma} L_{10}$$

Where:

$L_{10osc}$  = basic rating life, millions of cycles

$\gamma$  = oscillation amplitude (angle of maximum deviation from centre position), degrees

If oscillation of amplitude is very small, it can be ignored for basic dynamic rating life calculation. It will be only a static evaluation.

Fig. 1

### Fluctuating dynamic load and speeds

In many cases, operation speed and magnitude of the load fluctuates. Therefore a mean dynamic load is to be calculated.

Complete oscillation =  $4\gamma$  from point 0 to point 4. The load acting on the bearing can vary as shown in fig. 2-a and 2-b.

In this case, the mean load can be determined using the equation:

$$F_m = \sqrt[p]{\frac{F_1^p n_1 + F_2^p n_2 + \dots + F_n^p n_n}{n}}$$

Where:

$F_m$  - constant mean load, kN

$F_1, F_2, F_n$  - constant load during  $n_1, n_2, \dots, n_n$  revolutions, kN

$n$  - total number of revolutions ( $n=n_1+n_2+\dots+n_n$ ) during which loads  $F_1, F_2, \dots, F_n$  are acting

$p$  - exponent,

$p=3$  - for ball bearings

$p=10/3$  - for roller bearings

If the bearing speed is constant and the magnitude of load is between the minimum value  $F_{min}$  and a maximum value  $F_{max}$ , as shown in fig. 3 a and b, the mean load can be obtained from:

$$F_m = \frac{F_{min} + 2F_{max}}{3}, \text{ kN}$$

Fig. 2 a

Fig. 2 b

Fig. 3 a

Fig. 3 b

If the external radial load consists in a load  $F_1$  - constant as magnitude and direction) and a load  $F_2$  - variable as direction and constant as magnitude ( $F_1, F_2$  acting in the same plane) as shown in fig. 4, the mean load can be determined using the equation:

$$F_m = f_m(F_1 + F_2), \text{ kN}$$

Fig. 4

Values for the factor  $f_m$  can be obtained from fig.5.

In case of sinusoidal movement as it shown in fig.6, the mean load can be obtained from equation:

$$F_m = \sqrt{\frac{4}{3\pi}} F_{max}, \text{ kN}$$

$$F_m \approx 0,75 F_{max}, \text{ kN, for ball bearings}$$

$$F_m \approx 0,77 F_{max}, \text{ kN, for roller bearings}$$

In case of oscillating movements with angle  $\gamma$ , as shown in fig. 7, equivalent mean load can be calculated with the equation:

$$F_m = \sqrt{\frac{p}{90^\circ} \gamma} F_r, \text{ kN}$$

If the fluctuating load acts in a pure radial direction for radial bearings and in a pure axial direction for thrust bearings, the equivalent dynamic bearing load will be:

$$P_r = F_m.$$

For combined loads, with radial load  $F_r$  and axial load  $F_a$  constant in direction and magnitude, the equivalent dynamic load can be calculated using the equation:

$$P_r = X F_r + Y F_a, \text{ kN}$$

Fig. 5

Fig. 6

Fig. 7

In case of combined loads, with radial and axial loads changing in time, ratio  $F_r/F_a$  being constant, the equivalent dynamic load can be calculated by:

$$P_m = X F_{rm} + Y F_{am}, \text{ kN}$$

where:

$P_m$  - equivalent mean dynamic load, kN

$F_{rm}$  - radial mean load, kN

$F_{am}$  - axial mean load, kN

X, Y - factors of radial and axial load.

If direction and magnitude of load changes in time and speeds fluctuates in time, the equivalent mean dynamic load will be calculated using the equation:

$$P_m = \sqrt{\frac{P_1^p n_1 + P_2^p n_2 + \dots + P_n^p n_n}{n}}$$

where:

$P_m$  - equivalent mean dynamic load, kN

$P_1$  - equivalent dynamic load for  $n_1$  revolutions, kN

$P_2$  - equivalent dynamic load for  $n_2$  revolutions, kN

$P_n$  - equivalent dynamic load for  $n_n$  revolutions, kN

$n_1$  - number of revolutions for load  $P_1$

$n_2$  - number of revolutions for load  $P_2$

$n_n$  - number of revolutions for load  $P_n$

$n$  - number of revolutions ( $n = n_1 + n_2 + \dots + n_n$ )

$p$  - exponent: - 3 for ball bearings,

- 10/3 for roller bearings

## Basic dynamic load of a bearing group

If heavy radial loads must be carried, it is required a bearing group of the same type, mounted close together, especially in case of ball and roller bearings. In order to take over the load uniformly, these bearings should be mounted with equal diameter deviations and also radial clearances. These deviations must be kept below half of the admitted tolerance class.

Basic dynamic load for a bearing group, as a function of the basic load of the single bearing, can be calculated using the equation:

$$C_{ri} = C_r^n,$$

where:

$C_{ri}$  - basic dynamic load of the bearing group, kN

$C_r$  - basic dynamic load of the single bearing,

selected from the tables,

$i$  - number of bearings of the same type, mounted close together,

$n$  - exponent depending on the bearing type:

0,7 - for ball bearings

7/9 - for roller bearings

Values of  $i^n$  are given in table 2.6.

$i$	$i^{0,7}$	$i^{7/9}$
2	1,62	1,71
3	2,16	2,35
4	2,64	2,94

The equivalent basic dynamic load for each group of bearings is calculated considering specifications in the introductory text preceding the respective group.

## Adjusted rating life

Basic rating life  $L_{10}$  is often satisfactory for bearing performances. This life means a reliability of 90% for standard material and modern and usual manufacturing technologies, as well as for conventional operating conditions.

For a reliability over 90%, international standards recommends steels elaborated in better conditions, high level manufacturing technologies and specific operating conditions. In this case adjusted rated life can be calculated as follows:

$$L_{na} = a_1 a_2 a_3 L_{10} \text{ or } L_{na} = a_1 a_2 a_3 \left(\frac{C}{P}\right)^p$$

where:

$L_{na}$  – adjusted rating life, millions of revolutions

$a_1$  - life adjustment factor considering reliability

$a_2$  - life adjustment factor considering the material and manufacturing conditions

$a_3$  - life adjustment factor considering the operating conditions.

In case of life adjustment factors  $a_1$ ,  $a_2$ ,  $a_3$

greater than 1, when calculating adjusted rating life, prudence is recommended, because knowledge about bearings manufacture and operating conditions (shaft bending, housing stiffness, lubrication, temperature influence, etc.).

Values of the life adjustment factor  $a_1$  for reliabilities over 90% are given in table 2.7.

Reliability %	$L_{na}$	$a_1$
90	L10a	1
95	L5a	0,62
96	L4a	0,53
97	L3a	0,44
98	L2a	0,33
99	L1a	0,21

## Life adjustment factor $a_2$ for material

Life adjustment factor  $a_2$  takes into account the material properties, heat treatment of the steel and manufacturing technologies. For URB bearings,  $a_2=1$  is recommended.

## Life adjustment factor $a_{23}$ for operating conditions

The maximum life of a bearing can be reached in case of hydrodynamical lubrication, namely where is no direct contact between rolling elements and raceways due to the lubricant film. In this field, many studies have been done by world leading bearing manufacturers. These studies showed that there is a relationship between life adjustment factor  $a_2$  for material and life adjustment factor  $a_3$  for operating conditions. Preferably these factors should be unified, obtaining factor  $a_{23}$ . In this case, adjusted rating life would be:

$$L_n a = a_1 a_{23} L_{10}$$

These values of  $a_{23}$  factor depends on the lubricant used, namely on the ratio between the oil viscosity

required at +40°C,  $\nu$  (initial value) to the viscosity required for adequate lubrication at the operating temperature  $\nu_1$ . The values are given in table 2.8.

Values for factor $a_{23}$									
	Table 2.8								
$\frac{\nu}{\nu_1}$	0,1	0,2	0,5	1	1,5	2	3	4	5
$a_{23}$	0,45	0,55	0,75	1	1,3	1,6	2	2,5	2,5

The value of viscosity  $\nu_1$ , as a function of the mean bearing diameter and operating speed, are given in diagram fig. 8.

Kinematic viscosity  $\nu$  at the temperature of +40°C can be determined from diagram fig. 9, in accordance with ISO, if the bearing operating temperature is known.

In case of grease lubrication, calculation should be done considering the basic oil viscosity and the value of the life adjustment factor  $a_{23}$  will be smaller than 1.

Example of oil kinematic viscosity calculation for bearing lubrication:

The bearing 6212 operates at a speed of 3500 rpm and a temperature of +70° C.

Mean diameter will be:

$$D_m = 0,5(d+D) = 0,5(60+110) = 85 \text{ mm}$$

From the diagram fig. 9, at a temperature of +70° C, for a viscosity  $\nu_1 = 8 \text{ mm}^2/\text{s}$ , the viscosity at +40° C is 20  $\text{mm}^2/\text{s}$  (cSt).

In this case should be selected an oil in accordance with ISO VG 22 with kinematic viscosity limits:  $\nu_{\min} = 19,8 \text{ mm}^2/\text{s}$  (cSt) and  $\nu_{\max} = 24,2 \text{ mm}^2/\text{s}$  (cSt).

In case of bearing operating at temperatures higher than +150°C, an adjustment factor  $f_t$  for temperature should be added to the life adjustment factor  $a_{23}$ . Adjusted rating life will be:

$$L_{na} = a_1 a_{23} f_t L_{10}$$

Values for the life adjustment factor  $f_t$  for temperature are given in table 2.9.

Fig. 8

Values for temperature factor $f_t$				
	Table 2.9			
Operating temperature t°C	150	200	250	300
$f_t$	1	0,73	0,42	0,22

### Static load

When the bearing is stationary or rotates at slow movements or very low speeds (lower than 10 rpm), basic static load is not determined by the material fatigue but by permanent deformation caused at the rolling element/raceway contact.

It is also the case of rotating bearings, when they have to sustain heavy shock loads which act during a fraction of their revolution.

Generally, the value of the load may increase up to the value of the basic static load  $C_0$ , without altering the bearing operating properties.

### Equivalent static load

Combined static load (radial and axial load acting simultaneously on bearing) must be converted into an equivalent static bearing load. This is defined as the load (radial for radial bearings and axial for thrust bearings) which is applied, and would cause the

same permanent deformation in the bearing as the real load operating over it.

Equivalent static load is obtained from the general equation:

$$P_0 = X_0 F_r + Y_0 F_a, \text{ kN},$$

where:

- $P_0$  - equivalent bearing static load, kN,
- $F_r$  - radial component of the heaviest static load, kN,
- $F_a$  - axial component of the heaviest static load, kN,
- $X_0$  - radial load factor of the bearing,
- $Y_0$  - axial load factor of the bearing.

Data needed to calculate equivalent static load can be found in text and in bearing tables.

### Requisite basic static load rating

When determining bearing size on the basis of the static load, a static safety factor  $s_0$  is used.

Fig. 9

The requisite basic static load is calculated using the equation:

$$C_{r0} = s_0 P_{r0}, \text{ kN}$$

where:

- $C_{r0}$  - basic static load rating, kN
- $s_0$  - static safety factor, table 2.11

$P_{r0}$  - equivalent static load, kN.

At high temperatures, life of the material decreases and the static load carrying capacity of bearings is reduced.

For high temperatures, basic static load is calculated using the equation:

$$C_{r0} = f_{ot} s_0 P_{r0}, \text{ kN}$$

The values of factor  $f_{ot}$  depending on temperature is given in table 2.10.

Operating temperature $t^{\circ}\text{C}$	150	200	250	300
$f_{ot}$	1	0,95	0,85	0,75

### Non – rotating bearings

In case of non-rotating bearings, values of static safety factor  $s_0$ , for certain applications are given in table 2.11. These values are also valid for bearings with oscillating movements.

Application	$s_0$
Variable pitch propeller for aircraft	0,5
Dam gates, flood gates	
Opening bridges	1,5
Crane hooks for:	
*large cranes without additional loads	1,5
*small cranes with additional dynamic loads	1,6

### Rotating bearings

In case of fluctuating or oscillating loads and especially when heavy shock loads are acting during a fraction of revolution, it is necessary to check if the bearing has the proper static load carrying capacity. Heavy shock loads, higher than the basic static

bearing load, produce permanent deformations not uniformly distributed on raceway, which influence negatively bearing running.

Generally, heavy shock loads cannot be exactly calculated and in certain cases they produce deformations of bearing housing and consequently an unfavorable load distribution in bearing.

When a bearing rotates under maximum load, raceway becomes uniformly deformed on all its outer surface without any imprint.

For various operating conditions, maximum load acting upon the bearing is calculated with static safety factor  $s_0$ , depending on the vibrations and shock loads.

The values of static safety factor are given in table 2.12.

mounted close together to take over a static load, the load magnitude supported by these bearings will be calculated from:

$$C_{0ri} = C_{0r} i,$$

where:

$C_{0ri}$  - basic static load of the bearing group

$C_{0r}$  - basic static load of the single bearing (catalogue)

$i$  - number of bearings.

Values for static safety factor $s_0$						
Type of operation	Requirements regarding quiet running					
	Unimportant		Normal		High	
	Ball bearings	Roller	Ball bearings	Roller	Ball bearings	Roller
Smooth, vibration-free	0,5	1	1	1,5	2	3
Normal	0,5	1	1	1,5	2	3,5
Heavy shock loads	>1,5	>2,5	>1,5	>3	>2	>4

For bearing with a known equivalent static load, static safety factor  $s_0$  is necessary to be checked using the equation:

$$s_0 = \frac{C_{ro}}{P_{ro}}$$

If the value of  $s_0$  is less than recommended in table 2.12, then a bearing with a higher basic static load carrying capacity should be selected.

### Basic static load for a group of bearings

Where more bearings of the same type are

# Bearing tolerances

Bearing tolerances have been internationally standardized in accordance with ISO 492, ISO 199, ISO 582, ISO 1132.

Bearings are generally manufactured to the tolerance class P0. At request, they can also be manufactured to the tolerance classes P6, P6x, P5, P4 and P2. These bearings are used for special applications, such as very accurate shaft guidance or very high speeds.

The values of the limit deviations for these tolerance classes are given for:

- the overall dimensions of:
  - deep groove ball bearings, angular contact ball bearings, self-aligning ball bearings, spherical roller bearings, cylindrical roller bearings, tapered roller bearings,
  - tapered roller bearing with metric (mm) and inch dimensions,
  - tapered bore bearings,
  - thrust ball bearings, angular contact thrust ball bearings, cylindrical roller thrust bearings, needle roller thrust bearings.
- mounting chamfer.

## Symbols

- $d$  - nominal bore diameter or shaft washer nominal bore diameter for thrust bearings
- $d_1$  - nominal diameter at the theoretical large end of the tapered bore
- $d_2$  - nominal bore diameter of the shaft washer for double directions thrust bearings
- $d_s$  - deviation of single bore diameter
- $d_{psmax}$  - maximum bore diameter, in a single radial plane
- $d_{psmin}$  - minimum bore diameter, in a single radial plane
- $\Delta d_s$  - deviation of a single bore diameter  $\Delta d_s = d_s - d$
- $d_{mp}$  - mean bore diameter, in a single radial

- plane  $d_{mp} = (d_{psmax} + d_{psmin})/2$
- $\Delta d_{mp}$  - deviation of the mean bore diameter in a single radial plane; or deviation of the mean diameter at the theoretical small end of the tapered bore, in case of tapered bore bearings; or deviation of the mean bore diameter of the shaft washer in a single direction thrust bearings  $\Delta d_{mp} = d_{mp} - d$
- $\Delta d_{1mp}$  - deviation of the mean diameter at the theoretical large end of the tapered bore  $\Delta d_{1mp} = d_{1mp} - d$
- $\Delta d_{2mp}$  - deviation of the mean bore diameter of the shaft washer for a double directions thrust bearings, in a single radial plane
- $V_{dp}$  - bore diameter variation in a single radial plane; or bore diameter variation of the shaft washer in a single radial place, for single thrust bearings  $V_{dp} = d_{psmax} - d_{psmin}$
- $V_{d2p}$  - bore diameter variation of the shaft washer for double directions thrust bearings, in a single radial plane
- $V_{dmp}$  - mean bore diameter variation (valid only for cylindrical bore)  $V_{dmp} = d_{mpmax} - d_{mpmin}$
- $\alpha$  - nominal half-angle of the tapered bore
- $D$  - nominal outside diameter or housing washer nominal diameter
- $D_1$  - nominal outside diameter of the outer ring rib
- $D_s$  - single outside diameter maximum
- $D_{psmax}$  - outside diameter in a single radial plane minimum outside diameter in a single radial plane deviation of the single outside diameter  $\Delta D_s = D_s - D$
- $D_{psmin}$  - outside diameter in a single radial plane maximum
- $\Delta D_s$  - mean outside diameter, in a single plane  $= (D_{psmax} + D_{psmin})/2$
- $D_{mp}$  - deviation of the mean outside diameter in a single radial plane; or deviation of the mean diameter of housing washer in a single radial plane, for thrust bearings  $\Delta D_{mp} = D_{mp} - D$
- $\Delta D_{mp}$  - deviation of the mean outside diameter in a single radial plane; or deviation of the mean diameter of housing washer in a single radial plane, for thrust bearings  $\Delta D_{mp} = D_{mp} - D$
- $V_{DP}$  - outside diameter variation in a single

radial plane; or housing washer diameter variation in a single radial place for double direction thrust bearings  $V_{DP} = D_{psmax} - D_{psmin}$

- $V_{Dmp}$  - mean outside diameter variation
- $B$  - nominal width of the inner ring
- $B_s$  - single width of the inner ring
- $\Delta B_s$  - inner ring single width deviation  
 $\Delta B_s = B_s - B$
- $V_{Bs}$  - inner ring single width variation
- $C$  - nominal width of the outer ring
- $C_s$  - single width of the outer ring
- $\Delta C_s$  - deviation of the outer ring single width  
 $\Delta C_s = C_s - C$
- $V_{Cs}$  - single width variation of the outer ring  
 $V_{Cs} = C_{smax} - C_{smin}$
- $T$  - nominal width of tapered roller bearings
- $T_s$  - single width of tapered roller bearings
- $\Delta T_s$  - deviation of the single width of taper roller bearings  $\Delta T_s = T_s - T$
- $T_1$  - nominal width of the inner ring and tapered roller assembly
- $T_{1s}$  - single width of the inner ring and tapered roller assembly
- $\Delta T_{1s}$  - deviation of the single width of inner ring and tapered roller assembly  
 $\Delta T_{1s} = T_{1s} - T_1$
- $T_2$  - nominal width of the outer ring assembly
- $T_{2s}$  - single width of the outer ring assembly

- $\Delta T_{2s}$  - deviation of the single width of outer ring assembly  $\Delta T_{2s} = T_{2s} - T_2$
- $K_{ia}$  - radial runout of assembled bearing inner ring
- $K_{ea}$  - radial runout of assembled bearing outer ring
- $S_d$  - side face runout with reference to bore of the inner ring
- $S_D$  - variation in inclination of outside cylindrical surface to outer ring side face
- $S_{ia}$  - side face runout of assembled inner ring with reference to raceway
- $S_{ea}$  - side face runout of assembled outer ring with reference to raceway
- $S_i$  - thickness variation measured from middle of raceway to back seating face of shaft washer
- $S_e$  - thickness variation measured from middle of raceway to back face of housing washer
- $\Delta H_s$  - deviation of mounting height of single direction thrust ball and roller bearings
- $\Delta H_{1s}$  - deviation of mounting height of thrust ball bearings with sphered housing washer
- $\Delta H_{2s}$  - deviation of mounting height of double direction thrust ball and roller bearings,
- $\Delta H_{3s}$  - deviation of mounting height of double direction thrust ball bearings with sphered housing washer.

# Bearing applications

Radial and axial loads in bearing units can be transmitted by locating and non-locating bearings.

A locating bearing is generally used for medium and large-sized shafts that can reach high temperatures during operation. It has to support radially the shaft assembly and to locate it axially in both directions.

A non-locating bearing supports the shaft assembly only radially. It also allows axial displacement in relation to the housing to take place so that additional axial loading is avoided.

Axial displacement can take place either in the housing bore seating or in the bearing itself.

In case the shaft is supported by more than two bearings, only one of them will be a locating bearing and it will be the one with the lightest radial load.

In case of small-sized shafts, two non-locating bearings with limited displacement can be used. Each of them can accommodate axial loads in a single direction, having thus mutual location.

Fig. 4.1 shows a few of the most representative applications of locating and non-locating bearings, as follows:

a) The locating bearing is a single row deep groove ball bearing and the non-locating one is a cylindrical roller bearing with both rings tightly fitted on the shaft and into the housing, respectively.

b) Both bearings are supported by spherical roller bearings. The locating bearing is tightly fitted both on the shaft and into the housing. The non-locating bearing has the outer ring mounted with clearance into the housing and thus allows axial displacement in both directions.

c) The locating bearing consists of a cylindrical roller bearing, NUP type and the non-locating bearing consists of a cylindrical roller bearing, NU type.

d) The locating bearings consist of a cylindrical roller bearing, NU type which takes over radial loads and of a four-point contact ball bearing (unloaded on the outside). The non-locating bearing consists of a cylindrical roller bearing, NU type.

e) The locating bearings consists of a cylindrical

Fig. 4.1

roller bearing, NU type which take over radial loads and of a four-point contact ball bearing (unloaded on the outside). The non-locating bearing consists of a cylindrical roller bearing, NU type.

f) The locating bearing consists of a needle roller

bearing, NA type which takes over radial loads and of a single row deep groove ball bearing (unloaded on the outside) which takes over axial loads in both directions. The non-locating bearing consists of a needle roller bearing, NA type.

g) The shaft bearings can also be X-type arrangement of two tapered roller bearings which can be considered mutual located bearing.

### Recommendation for bearing fit selection

Three main criteria have to be considered when selecting the bearing fit:

- Firm location and uniform support of bearings;
- Simply mounting and dismounting;
- Axial displacement of non-locating bearing.

The most common location is assured by tight fit.

A high tightening is recommended for roller bearings and large-sized bearings in comparison to ball bearings of the same size.

In case of a tight fit, the inner ring is supported by the entire shaft contact surface, thus bearing is used at full load carrying capacity.

The tolerance classes given in table 4.1 and 4.3 are available for bearing fits which do not exceed  $+120^\circ$  during operation.

As a general rule, selection of the tolerance class "H" is recommended for bearings of separable design and tolerance class "J" for bearings of non-separable design.

When selecting a fit, the load of rotating ring has to consider, namely:

- If the inner ring rotates and the load is stationary, the outer ring should be mounted with clearance fit.
- If the inner ring rotates and the load is stationary, the outer ring should be mounted with a tight fit.
- If the inner ring rotates and the direction of load is not determined, both rings should be mounted with a tight fit.

In table 4.1, there are given recommendations to select the tolerance class for shaft as function of: bearing type, loading and shaft diameter. In table 4.3, one can find recommendations to select the

tolerance class for housing,

Figure 4.2 shows schematically the tolerance classes for shaft and housing and their influence over fit type i.e. clearance, transition or tight fit for housing and transition fit or tight fit for shaft, respectively.

In tables 4.2 and 4.4, the deviations of the shaft diameter (4.2) and of the housing diameter (4.4) are given, considering the following:

- upper and lower limits
- theoretical minimum and maximum values of tightening (+) or clearance (0) in the fit.
- the minimum and maximum values of the probable tightening or clearance in the fit (99% of fits are between these limits).

The tolerances of bore diameter  $d_{mp}$  and outside diameter  $D_{mp}$  are valid for all metric sized bearings, except tapered roller bearings with  $d < 30$  mm and  $D < 150$  mm and thrust ball bearings with  $D \leq 150$  mm, (see table 3.15 and 3.16 on page 34 and table 3.31 and 3.32 on page 39-40).

**Bearing application**  
Tolerance classes for housing bores  
Radial bearings

Table 4.3

<b>Solid housing Operating conditions</b>	<b>Examples</b>	<b>Tolerance class symbol</b>	<b>Outer ring displacement</b>
<b>Rotating outer ring load</b>			
Heavy loads on bearings in thin-walled housings, heavy shock loads ( $P > 0,12 C$ )	Roller bearing wheel hubs, connecting rod bearings	P7	Outer ring cannot be displaced
Normal and heavy loads ( $P > 0,06 C$ )	Ball bearing wheel hubs, connecting rod bearings, crane traveling wheels	N7	
Light and variable loads ( $P \leq 0,06 C$ )	Conveyor rollers, rope sheaves, belt tension pulleys	M7	
<b>Direction of load indeterminate</b>			
Heavy shock loads	Traction motors	M7	Outer ring cannot be displaced
Normal and heavy loads ( $P > 0,06 C$ ) Outer ring displacement is not necessary	Electric motors, pumps, crankshaft main bearings	K7	

<b>Split or solid housing Operating conditions</b>	<b>Examples</b>	<b>Tolerance class symbol</b>	<b>Outer ring displacement</b>
<b>Direction of load indeterminate</b>			
Light and normal loads Desirable outer ring displacement ( $P \leq 0,12 C$ )	Medium-sized electric motors, pumps, crankshaft main bearings	J7	Outer ring cannot be displaced
<b>Stationery outer ring load</b>			
All kind of loads	General mechanical engineering, railway axleboxes	H7	Outer ring can be easily displaced
Light and normal loads with simple conditions ( $P \leq 0,12 C$ )		H8	
Heat conduction through shaft	Drying cylinders, large electrical machines with spherical roller bearings	G7	

<b>Bearing application</b> <b>Tolerance classes for housing bores</b> <b>Radial bearings</b>			
Table 4.3 (continued)			
Split housing Operating conditions	Examples	Tolerance class symbol	Outer ring displacement
High accuracy rotation, quiet running			
High stiffness at variable loads	Main shafts for machine-tools with roller bearings	D $\leq$ 125 M6 D>125 N6	The outer ring cannot be displaced.
Light loads, indeterminate load direction	Shaft operating surface for grinding machines with ball bearing, free bearing for high speed superchargers	K6	The outer ring cannot be displaced.
Desirable outer ring displacement	Shaft operating surface for grinding machines with ball bearing, free bearing for high speed superchargers	J6	The outer ring can be displaced.
Quiet running	Small-sized electrical machines	H6	The outer ring can be easily displaced

<b>Tolerance classes for housing bores</b> <b>Thrust bearings</b>		
Table 4.3 (continued)		
Thrust bearings Operating conditions	Tolerance class symbol	Outer ring displacement
<b>Axial load</b>		
Thrust ball bearings Cylindrical and needle roller thrust bearings	H8 H7 (H9)	For less accurate bearing arrangements, radial clearance in housing can be up to 0,001 D
<b>Combined loads on spherical roller thrust bearings</b>		
Local load on housing washer Peripheral load on housing washer	H7 (H9) M7	
<b>Axial or combined load on spherical roller thrust bearings</b>		
Bearing radial location is ensured by another bearing	-	Housing washer fitted with clearance up to 0,001 D

**Deviations of form and position**

Permissible deviations of form and position for shaft and housing where bearings will be mounted are given in fig. 4.3 and table 4.5

Fig. 4.3

Table 4.5

Tolerance name	Fit	Symbol of deviation		Permissible deviations depending on the tolerance class				
				P0 P6X	P6	P5	P4 (SP)	P2 (UP)
Tolerance of dimension	shaft		-	IT6(IT5)	IT5	IT4	IT4	IT3
	housing			IT7(IT6)	IT6	IT5	IT4	IT4
Tolerance of roundness and cylindricity	shaft	○ ○	$t, t_1$	IT4/2 (IT3/2)	IT3/2 (IT2/2)	IT2/2	IT1/2	IT0/2
	housing		$t, t_1$	IT5/2 (IT4/2)	IT4/2 (IT2/2)	IT3/2	IT2/2	IT1/2
Tolerance of face runout	shaft	↗	$t_2$	IT4(IT3)	IT3(IT2)	IT2	IT1	IT0
	housing			IT5(IT4)	IT4(IT3)	IT3	IT2	IT1
Tolerance of concentricity	shaft	◎	$t_3$	IT5	IT4	IT4	IT3	IT3
	housing			IT6	IT5	IT5	IT4	IT3
Tolerance of angularity	shaft	∠	$t_4$	IT7/2	IT6/2	IT4/2	IT3/2	IT2/2

In case of bearings on which adapter or withdrawal sleeves are to be mounted, the shaft tolerances for deviations of form and position should be to IT5/2 tolerance class for shafts with diameter tolerance h9 and IT7/2 for shaft tolerance h10.

Surface roughness of bearing seating is given in table 4.6.

Shaft and housing mounting surfaces roughness								Table 4.6				
Bearing tolerance class	Shaft					Housing						
	Diameter d, mm					Diameter D, mm						
	≤ 80		>80...500		> 500	≤ 80		> 80... 500		> 500		
Roughness Ra, [μm]												
<b>P0, P6X and P6</b>	0,8	(N6)	1,6	(N7)	3,2	(N8)	0,8	(N6)	1,6	(N7)	3,2	(N8)
<b>P5, SP and P4</b>	0,4	(N5)	0,8	(N6)	1,6	(N7)	0,8	(N6)	1,6	(N7)	1,6	(N7)
<b>P2 and UP</b>	0,2	(N4)	0,4	(N5)	0,8	(N6)	0,4	(N5)	0,8	(N6)	0,8	(N6)

If bearings are mounted with adapter or withdrawal sleeves, shaft surface roughness should be of max. Ra = 1,6 μm

The values of fundamental tolerances – ISO (tolerance classes IT0...IT12) are given in table 4.7.

## Bearing axial location

Axial location of the bearing is necessary for a proper guiding of bearing in an assembly under operation.

A tight fit is inadequate for the axial location of bearing. In case of locating bearings, axial location for both rings is generally needed. Some important solutions of bearing axial location, on shaft or into the housing are shown in Fig. 4.4.

In case of bearings with light axial loads, bearings can be located using a lock nut and a lock washer (a), an end plate fastened by a screw at the shaft end (b) and, for bearings carrying light axial loads, by lock rings mounted in shaft and housing grooves (c).

Bearing with NR design, with groove and snap ring on the outer ring, can be easily located by the lock ring (d). Tapered roller bearings can be located by supporting the inner ring on the shaft shoulder and the outer ring with a threaded ring and a safety plate fastened by a screw (e).

Tapered bore bearings can be mounted and axially located by adapter or withdrawal sleeves (f,g).

The axial load carrying capacity of the bearings mounted with adapter or withdrawal sleeves is governed by the friction between shaft and sleeve (g).

To locate radial bearings, where axial adjustment of the shaft is required, setting washers (i) or spacer rings (i) are used between the outer rings, the width of the spacer ring being experimentally determined, during mounting.

Fig. 4.4

## Bearing sealing

Seals are used in most of bearing arrangements and they must ensure the conditions of a proper operation.

For such a purpose, they have to prevent solid contaminants (dust, hard particles, water, aggressive substances etc) from penetrating into the bearing and at the same time to retain the lubricant in the bearing.

Seals for rolling bearings can be classified

considering some important criteria such as: design, operations, type of lubricant etc.

Considering their design and operation, seals can be: stationary seals between the stationary bearing elements (housing and cover), rotary seals, between the rotating bearing elements and they also can be rubbing seals or non-rubbing seals, which are used in special applications (surrounding conditions and loading stress).

Rotary non-rubbing seals are often used due to their simple design. They are particularly used at high speeds or temperature, both for grease and oil, and have practically no friction and do not wear.

In case of bearing grease lubrication, bearing operating temperature must be lower with 20°C than the dropping point of the grease (melting temperature).

The main constructive types of rotary non-rubbing seals have narrow gaps, labyrinths and their combinations are shown in fig 4.5 a-c.

Fig. 4.5

Gap seals represent the simplest constructive solution for a rotary non-rubbing seal which have to retain grease in the bearing housing. The efficacy of sealing depends on the gap length (L) and the clearance between shaft and housing. It can be improved by providing one or more circular grooves on the shaft or in the housing, which are to be filled with grease (b). In case of oil lubrication, the grooves on the shaft must be helical (c) and their direction must be the same with the direction on the shaft rotary movement.

Experiments proved that most favorable clearance is obtained between the limits of the fit A11/h10, geometrical deviations should be IT6 and gap surface roughness  $R_a=12,6 \mu\text{m}$ .

Labyrinth seals are used at high peripheral speeds, in impure surroundings.

They are shows in fig. 4.6 a-d.

Fig. 4.6

The labyrinths are spaces where periodically water-in-soluble grease (e.g. Lithium or Calcium base grease) is to be supplied.

The tongues of the labyrinth seals can be radially (a), axially (b) arranged or they can have inclined passages.

Details of an axial labyrinth design are given in fig. 4.6 d and values of axial clearance and length L are given in table 4.8.

In case of rotary rubbing seals there is a direct contact between elastic seal element and the rotating element. They are shown in fig. 4.8.

When selecting the proper rotary rubbing seal, the following factors have to be considered: material and its elasticity (felt, rubber, plastics, leather, graphite, asbestos etc.); resistance at various temperatures, maximum peripheral speeds on sealing surface; sealing direction etc.

Fig. 4.7

These systems have sealing properties higher than those corresponding to non-rubbing seals. In case of grease lubrication at peripheral speeds higher than 4m/s and temperatures over +100°C, felt ring seals (a) are frequently used because of their simple design and cheapness.

Before mounting, felt rings are impregnated during one hour with a mixture of mineral oil (66%) and paraffin (34%), at a temperature of +70...+80°C so that sealing properties are improved as the friction is reduced.

At higher temperatures and peripheral speeds over 12 m/s, surface roughness is  $R_a=1,6 \mu\text{m}$  and the space between the ends of the seal should be filled with grease. Two felt rings can be used for sealing.

Rubbing seals with a spring incorporated are preferably to be used in case of oil lubricated bearings which are operated under peripheral speeds of 5-10 m/s, temperatures between -40°C and +20°C. Their efficacy depends on the material and operating surroundings.

In most cases, rubbing seals with a spring incorporated are made of synthetic rubber and have a metallic hardening fixture.

Inclined sealing surfaces are recommended to be ground  $R_a=0,8 \mu\text{m}$  and hardened at 45 HRC, when operating at peripheral speeds over 8 m/s. Lubricant outflow can be stopped by mounting the rubbing seal with incorporated spring with edge inwards (c)

Fig. 4.8

or outwards (d) if sealing has to prevent dust or other impurities from penetrating into the bearing.

Double sealing with these rubbing seals can also be used.

V-ring seal is used to prevent dust or contaminants from penetrating into the bearing with best results both in case of grease or oil lubrication. The elastic rubber lip of the V-ring seal is notched on the plane sealing surface, drawing the fluids in centrifugal motion. V-ring seals are used at temperatures of -40°C...+100°C roughness of sealing surface being  $R_a=1,5 - 3 \mu\text{m}$ . Generally, at peripheral speeds up to 15 m/s, the V-ring seal operates as a rubbing seal (seal lip reaches sealing surface), and at peripheral speeds over 15 m/s the seal lip will lift from the

sealing surface, operating as a centrifugal sealing.

V-ring seals can also be used in case of angular misalignment of the shaft ( $2^{\circ}\text{C} \dots 3^{\circ}\text{C}$ ) as they are made of high quality, elastic rubber, easy to be mounted.

The efficacy of sealing depends on the fact that the body ring acts as a flinger for dirt and fluids. Therefore, with grease lubrication the seal is generally arranged outside the housing and with oil lubrication it is placed inside the housing.

Pressed sheet washers provide simple, inexpensive and space-saving sealing especially for grease lubricated deep groove ball bearings. The washers are clamped against either the outer ring or the inner ring and exert a resilient pressure axially against the rubbing ring. In case of usual applications, the types of seals mentioned above or their combinations shown in fig. 4.9 are used, some of them becoming standard seals for rolling bearings (e.g. labyrinths, felt rings, V-rings etc). Thus, better sealing can be obtained if felt ring (a) or V-ring (b) rubbing seals are combined with radial or axial labyrinth non-rubbing seals.

Fig. 4.10

Fig. 4.9

Special seals are used in case of unusual surroundings and loading conditions (e.g. rolling mills, helm of ocean-vessels, main shaft of grinding machines etc).

Sealed bearings of the type 2RS (2RSR) (a) or shielded bearings of the type 2Z (2ZR) (b) shown in fig. 4.10 a.b. provide simple and inexpensive sealing, with upper operating results. These rolling bearings are delivered ready greased, provision for relubrication and maintenance are not needed. They are used in case of bearings with small free space where other seals cannot be used.

# Bearing lubrication

Safe operating and long rating life of bearings depend on the lubricant type and quality and on the lubrication method. Bearing lubrication is used for certain purposes, such as:

- to reduce friction between rolling elements and raceway, rolling elements and cage
- to reduce friction between rolling elements and raceway, rolling elements and cage, cage and guiding ribs of rings during operation;
- to ensure anticorrosive protection of bearings;
- to reduce noise in bearing within certain limits;
- to distribute heat uniformly in contact areas and to remove it outside through lubricant circulation.

Lubricants for bearings lubrication should satisfy the following conditions:

- they should have physical and chemical stability;
- foreign mechanical substances (abrasive, metallic substances etc.) are not admitted in lubricant;
- they should have a minimal coefficient of friction;
- to be non-corrosive;
- good unctuousity (lubricating capacity).

There are two categories of lubricants used for bearing lubrication:

- fluid lubricants (oils);
- plastic lubricants (greases).

Table 5.1 shows comparison between fluid and plastic lubricants.

Although fluid lubricants have better characteristics than plastic lubricants, they cannot be used in all cases because of sealing difficulties.

Characteristics	Lubricant	
	Fluid	Plastic
speed	any value	low and medium
friction	low (reduced)	high
unctuousity	excellent	good
service life	long	short
cooling effect	high	low
replacement	easy	difficult

## Selection of lubricants

When selecting lubricants, much care is needed and all operating conditions and lubricant properties

should be considered.

No lubrication system can be considered universal. The most important criteria when selecting a lubricant have to be as follows:

- size of bearing
- speed
- load
- bearing operating temperature

These characteristic act upon lubricant viscosity as follows:

- the higher the bearing size, value of load and temperature, the higher the viscosity
- bearing speed acts by product  $D_m * n$ , as show in table 5.2.

$D_m * n$ over	up to	Lubricant type
-	150x10 <sup>3</sup>	Mineral oil and grease with medium or high viscosity
150x10 <sup>3</sup>	300x10 <sup>3</sup>	Mineral oil with medium viscosity and grease
300x10 <sup>3</sup>	500x10 <sup>3</sup>	Mineral oil with low viscosity and grease
500x10 <sup>3</sup>	1200x10 <sup>3</sup>	Mineral oil with low viscosity and lubricating equipment

## Grease lubrication

Grease can be used to lubricate rolling bearings only when product  $D_m * n \leq 500x10^3$  and it offers the following advantages:

- bearing speed acts by product  $D_m n$ , as show in table 5.2.
- it is more easily retained in the bearing;
- it assures anti-corrosive protection to bearing as it is water-resistant;
- low expenses for sealing.

The grease quantity to be supplied shouldn't be excessive, otherwise rotation is bracket, friction increases and also operating temperature without extending the bearing rating life.

The quantity of grease that is to be inserted in bearing seating should be as follows, considering the free space inside the housing:

- 1/2... 3/4 of the free space in the housing, in case of normal speeds;
- 1/3 of the free space in the housing, in case of high speeds and speed limit;
- whole housing freespace should be free, in case of low speeds and product  $D_m * n < 10 \times 10^3$ .

The quantity of grease can be calculated as a function of bearing bore diameter using the equation:

$$G = K d^{2.5}, g.$$

where:

- K= 1/900 - for ball bearings
- K= 1/350 - for roller bearings
- d = bore diameter, mm

Relubrication intervals in most cases can be experimentally determined and depend on:

- bearing type
- bearing size
- operating temperature
- grease properties

Grease service life and rubricating interval can be calculated from:

$$T_{ur} = k_0 \left( \frac{14 \cdot 10^6}{n\sqrt{d}} - 4d \right) f_1 f_2,$$

where:

$T_{ur}$  = service life or rubricating interval, in operating hours

$k_0$  = coefficient depending on the bearing type, table 5.3

n = speed, r/min

d = bore diameter, mm

$f_1$  = temperature factor, table 5.4

$f_2$  = factor depending on the operating conditions, table 5.5

Low values are valid for deep groove ball bearings with shields, 2Z type, or with seals, 2RS type, series 60, 62 and 63.

Bearing relubrication interval can be also determined using the chart - fig. 5.1, as a function of bearing type, bore diameter and speed.

### Example:

A bearing 6208-2RSR is operated under reduced load (it is not considered for calculation), at a speed  $n = 1500$  r/min, at a temperature of +60 deg C, light operating conditions. What is the grease service life and relubrication interval?

Grease service life will be:

$$T_u = k_0 \cdot \left( \frac{14 \times 10^6}{n\sqrt{d}} - 4d \right) f_1 f_2 = 32\ 893 \text{ hours.}$$

$k_0 = 25$ , from table 5.3

d = 40 mm

$f_1 = 1$ , from table 5.4

$f_2 = 1$ , from table 5.5

Relubrication interval:

$$T_r = k_0 \cdot \left( \frac{14 \times 10^6}{n\sqrt{d}} - 4d \right) f_1 f_2 = 13\ 157 \text{ hours.}$$

$k_0 = 10$ , from table 5.3

$f_1, f_2 = 1$ , from tables 5.4, 5.5.

The grease quantity to be supplied can be determined using the equation:

$$G = K D B, g,$$

Values for coefficient $k_0$		
Table 5.3		
Bearing type	Value of $k_0$	
	Relubrication interval	Grease service life
Angular contact ball bearings Tapered roller bearings Thrust ball bearings	1	2
Cylindrical roller bearings	5	15
Deep groove ball bearings	10	20...40

Values for factor $f_1$			
Table 5.4			
Temperature	70°C	85°C	100°C
Factor $f_1$	1	0,5	0,25

Values for factor $f_2$				
Table 5.5				
Operating conditions	Light	Moderate	Heavy	Very heavy
Factor $f_2$	1	0,7...0,9	0,4...0,7	0,1...0,4

Values for coefficient K	
Table 5.6	
Relubrication interval	K
weekly	0,0015...0,0020
monthly	0,0020...0,0030
yearly	0,0030...0,0045
after 2...3 years	0,0045...0,0055

From the diagram fig. 5.1, the value of the relubrication interval will be of 13500 operating hours.

where:

G = grease quantity, g

K = coefficient depending on the relubrication interval, table 5.6

D = bearing outside diameter, mm

B = total bearing width for radial bearings, mm and total bearing height for thrust bearings, mm

The chart in fig. 5.1 applies to operating temperatures which do not exceed +70°C. For operating temperatures over +70°C, see table 5.4. Grease service life can be defined as the period of time when it preserves physical and mechanical characteristics in time and oxidizing due to temperature and vaporization of base oil doesn't occur.

Fig. 5.1

**Scale a; deep groove ball bearings**  
**Scale b; cylindrical roller bearings**  
**Scale c; spherical roller bearings, thrust ball bearings, cylindrical roller bearings without cage.**

A more accurate calculation of grease service life, considering grease quality and bearing operating conditions (load, size, speed, temperature etc.) can be done using the equation:

$$L = 10^{a-(m_1+m_2+m_3)}$$

where:

L = service life, operating hours

a = exponent depending on the grease quality (a=5,8... 6,1)

m1... m3 = exponents which take into account the following factors:

$$m_1 = 4,4 \times 10^{-8} D_m * n,$$

$$m_2 = 2,5 (P/C - 0,05),$$

$$m_3 = (0,021 - 1,80 \times 10^{-6} D_m * n) t,$$

$D_m$  = bearing mean diameter, mm

n = bearing speeds, r/min,

P = equivalent radial load, kN,

C = basic dynamic load, kN,

t = bearing operating temperature, °C

When calculating the values of t,  $D_m * n$  and P/C, the following have to be considered:

- when bearing operating temperature is lower than +50°C, then t = +50°C

- when speed factor  $D_m * n < 125000$ , then  $D_m * n = 125000$

- when ratio P/C < 0,05, then P/C = 0,05

Grease service life, as a function of operating temperature can be approximately determined using the diagram fig. 5.2.

Fig. 5.2

**Example 1**

A bearing 6210 operates under a load  $Pr = 5 \text{ kN}$ , speed  $n = 3000 \text{ r/min}$  at an operating temperature  $t = 50^\circ\text{C}$ . What is the service life of the grease used for bearing lubrication?

$$Cr = 35,1 \text{ kN, tables on page 100. bearing 6210}$$

$$L = 10^{a-(m_1+m_2+m_3)} = 10^{6,1-2,273} = 6214 \text{ hours}$$

$$a = 6,1, \text{ for Mobil grease,}$$

$$D_m * n = 65 \times 3000 = 195 \times 10^3$$

$$Pr/Cr = 5/35,1 = 0,143$$

$$m_1 = 4,4 \times 10^{-6} D_m * n = 0,858$$

$$m_2 = 2,5 (Pr/Cr - 0,05) = 0,23$$

$$m_3 = (0,021 - 1,80 \times 10^{-8} D_m * n) 65 = 1,119$$

**Example 2**

For the same bearing and operating conditions as in Example 1, it is required to find the service life of the same grease at a temperature of  $t = 95^\circ\text{C}$ .

$$m_3 = 1,66$$

$$m_1 + m_2 + m_3 = 2,794$$

$$L = 10^{6,1-2,794} = 10^{3,306} = 1774 \text{ operating hours}$$

From the diagram fig. 5.2, we can find approximately the same value, respectively 6000 operating hours at  $+65^\circ\text{C}$  and 170° operating hours at  $+95^\circ\text{C}$ .

Table 5.7 shows technical characteristics of usual grease, which are recommended for lubrication of sealed and shielded bearings, 2RS and 2Z types and also for rolling bearings in various assembled and machines.

Technical characteristics for usual greases for bearing lubrication					
Application	Thickener	Base Oil Viscosity @40°C	NLGI	Operating temperature range	Grease
General purpose industrial use, normal operation condition	Lithium	150	2	-30...+120	Mobilux EP2
	Lithium	100	3	-20...+130	Shell Gadus S2 V100 3
High temperatures and speeds. Long life. Low-noise performance (electric motors).	Polyurea	113	2	-20...+160	Mobil Polyrex™ EM
	Polyurea , EP	220	2	-20...+160	Shell Gadus S3 T220 2

High-speed and spindle bearing grease	Polyurea	22	-	-50...+120	Klüberspeed BF 72-22
Low noise, high purity	Polyurea	72	-	-45...+180	Klüberquit BQ 72-72

Table 5.7

When selecting a grease, following properties should be analyzed (thickener type, oil viscosity, operating conditions and application, NLGI grade -consistency).

Also, consult very carefully grease data sheet.

## Oil lubrication

Oil lubrication can be used in any operating condition, but this kind of lubrication is compulsory when the value of the product  $D_m * n$  from table 5.2 is exceeded for grease, namely  $D_m * n > 500 \times 10^3$  and when high temperatures occur in bearing. Then, oil has to lubricate and to remove heat from bearing.

Oils used for bearing lubrication can be:

- mineral oils, used up to a temperature of +150°C.

- synthetic oils, used up to a temperature of +220°C.

For a proper lubrication of bearings, low quantities of lubricants to reach the rolling elements are needed.

The lubricating systems must provide oil quantity necessary to prevent oil draining from bearing and heat removal in case of high speeds.

Most usual oil lubricating systems depending on factor  $D_m * n$  are given in tables 5.8.

Oil lubricating systems <span style="float: right;">Table 5.8</span>				
Lubricating system	Operating conditions	Factor $D_m * n$	Oil viscosity at 40°C	Example in fig.
m <sup>2</sup> /s				
Oil bath	Bath is filled up to the lowest rolling element for horizontal shaft and 70-80% of bath width for vertical shaft	$< 250 \times 10^3$	$(17...300) \times 10^{-6}$	5.3 a), b)
Oil bath with external circulation	Central tank, oil circulates under a pressure of 1,5 MPa. High speeds.	$< 600 \times 10^3$	$(45...175) \times 10^{-6}$	5,4
Oil injection	Oil is injected into the operating area under a pressure of 0,1...0,5 MPa, with flow capacity of 0,5...10 l/min depending on temperature. Heavy loads and high speeds.	$< 900 \times 10^3$	$(13,5...80) \times 10^{-6}$	5,5
Oil spot	Oil in air current under a pressure of (0,05...0,5) MPa, flow capacity of (0,5...4) m <sup>3</sup> /hour for small and medium sized bearings, heavy loads and high speeds.	$< 1200 \times 10^3$	$(10...45) \times 10^{-6}$	5,6

Fig. 5.3

Fig. 5.4

Fig. 5.5

Fig. 5.6

Approximate values of oil kinematic viscosity at +40°C depending on the operating temperature are given in table 5.9.

Temperature t°C		Viscosity at 40°C, cSt
over	up to	
-	50	12...60
50	80	37...75,5
80	120	> 75,5
120	150	227

Diagram fig. 5.7 shows kinematic viscosity classes at 40°C in accordance with ISO, its variation depending on the operating temperature (t°C) in relation to speed and bearing mean diameter (Dm).

### Example

A bearing 6204 is to operate under a speed  $n = 2000$  r/min at a temperature  $t = +65^{\circ}\text{C}$ .

$D_m = 0,5 (d+D) = 35,5$  mm.

The viscosity of the oil for bearing lubrication is required.

From the diagram, for  $D_m = 35,5$  mm, we can find viscosity at +65°C,  $\nu_1 = 13$  cSt and viscosity at + 40°C,  $\nu = 32$ cSt.

Table 5.10 shows oils which are recommended by ISO for bearing lubrication. Values of kinematic viscosity at +40°C, mm<sup>2</sup>/s are also given.

Class	ISO	Kinematic viscosity at +40°C, mm <sup>2</sup> /s (cSt)		
		mean	low	high
ISO VG	2	2,2	1,98	2,42
ISO VG	3	3,2	2,88	3,52
ISO VG	5	4,6	4,14	5,06
ISO VG	7	6,8	6,12	7,48
ISO VG	10	10	9	11
ISO VG	15	15	13,5	16,5
ISO VG	22	22	19,8	24,2
ISO VG	32	32	28,8	35,2
ISO VG	46	46	41,4	50,6
ISO VG	68	68	61,2	74,8
ISO VG	100	100	90	110
ISO VG	150	150	135	165
ISO VG	220	220	198	242
ISO VG	320	320	288	352
ISO VG	460	460	414	506
ISO VG	680	680	612	748
ISO VG	1000	1000	900	1100
ISO VG	1500	1500	1350	1650

Fig. 5.7

# Bearing designation

The purpose of designation is that of identification of bearings, so that bearings with the same designation to be interchangeable both dimensionally and operationally, no matter who the producers may be. Designation of URB rolling bearings are in

accordance with those used by world-know bearing companies: SKF, FAG , INA, KOYO etc.

The complete designation of a bearing consists of a basic design and may include one or more supplementary designations (prefixes and suffixes), as shown in chart fig. 6.1.

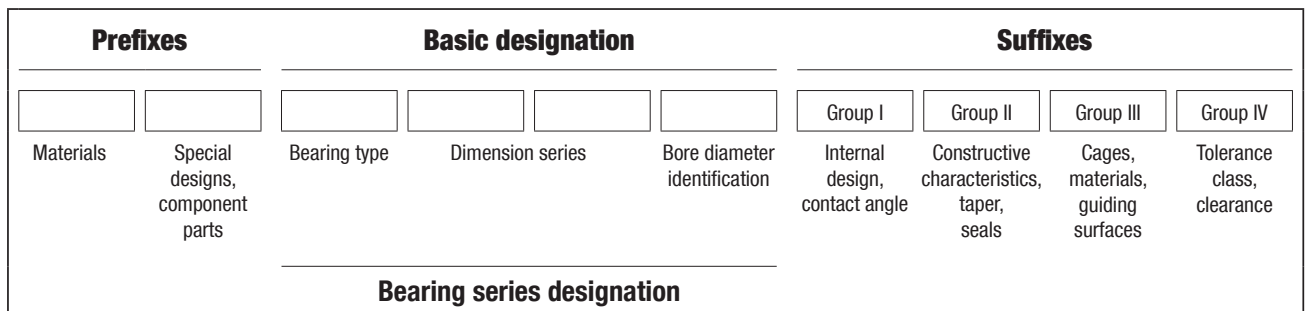

Fig. 6.1

The basic designation consists of an identification of the type of bearing (figure or letter), the series designation, in accordance with ISO and the bore diameter identification.

The designation of the bearing type and dimension series, for main standardized bearing types, is given in table 6.1.

Bore diameter identification consist of one, two or more figures as follows:

- bore diameter from 1 to 9 mm      - one figure, representing the bore diameter (e.g. 623, 608);
- bore diameter from 10 to 495 mm      - two figures, as follows: 00 for 10 mm, 01 for 12 mm, 02 for 15 mm, 03 for 17 mm, 04 and up to 99 for bore diameter from 20 to 495 mm. (bore diameter = bore diameter identification x 5, e.g. 6230, d=150 mm);

- bore diameter of 500 mm and over 500 mm

- is stated directly separated by a slash, the same applies to the values which are not perfect multiples of 5, or if they include a decimal point (e.g. 610/560, 62/32, 62/1,5).

Tapered roller bearings with inch dimensions listed in this catalogues make an exception from this rule.

## Prefixes

Prefixes are letter-identifications which indicate the material, other than steel for bearings or component parts of bearing. The prefix for material is separated by a horizontal line from the rest of designation.

### Prefixes for materials

- H** - heat-resisting steel (e.g. H - NUP 210)
- M** - copper alloy (e.g. M - 6008)
- S** - plastics, glass, ceramics etc. (e.g. S - 6204)
- T** - case-hardening steel (e.g. T - 35352)

## Prefixes for special designs or parts of bearings

- K** - cage with rolling elements of dismountable bearing (e.g. KNU205)
- L** - free ring of dismountable bearing (e.g. LNU205) (interchangeable ring, e.g. L30205)
- R** - dismountable bearing without free ring (e.g. RNU205; RN205)
- E** - shaft washer of thrust ball bearing (e.g. E51210)
- W** - housing washer of thrust ball bearing (e.g. W51216)

## Suffixes

Suffixes are used to identify various constructive modifications of the bearing in comparison to normal design. They are classified in four different groups, as follows:

- Group I - Modifications of internal design, design with increased basic load (e.g. A, C, E etc.), contact angle (e.g. A, B, C) and others.
- Group II - Modifications of external design, tapered bore, groove on outer ring etc. (e.g. 30205A, 1210K, 6210NR, 6310-2RS)
- Group III - Modifications of cage design, material, guiding surfaces etc. (e.g. 6205TN, NU310MA)
- Group IV - Modifications of normal design regarding tolerance classes, bearing radial or axial clearance, stability of dimensions at high temperatures, bearing matching etc. (e.g. 6206P5, 6310P53, NU210SO, 7010CDB).

These suffixes for bearing designation are listed considering the groups they belong to, at the beginning of each bearing group.

Designation of the type and dimension series for the standardized bearings

## Mounting and dismounting

Proper operation of rolling bearings is also determined by a proper selection of the solution of mounting and dismounting, considering the type and size of bearing, fit, adequate tools for these operations, performance etc.

As being precision components, rolling bearings should be handled carefully when storing or mounting. Thus, the following conditions should be observed:

- storing in their original package, on special shelves, in dry room, temperature of  $+18^{\circ}\text{C} \dots +20^{\circ}\text{C}$ , maximum moisture degree of 60%
- handling bearings, while storing and mounting, should be carefully done so that original package to be protected and not to be deteriorated
- bearings should be unpacked only when they are to be mounted

They shouldn't be washed if original package hasn't been destroyed

- as the adjoin parts of bearing are accurate, without burrs, chips or hits, special care should be taken.

Fig. 7.1

Fig. 7.2

### Mounting of bearings with cylindrical bore

Bearings with cylindrical bore which are to have tight fit on shaft or in housing respectively will be mounted by mechanical, thermic or hydraulic means.

The pressing force should be transmitted only by the ring which is pressed on the shaft or into the housing bore. Transmission by rolling bearings should be avoided as they can get deformed and premature damage can occur.

Special sleeves with one or two ribs, fig. 7.1, a and b are used when mounting small and medium-sized bearings, which are to be mounted with transition fit. In case of self-aligning ball bearings or spherical roller thrust bearings, a plate is mounted for a proper location of the outer rings, as shown in fig. 7.2.

Mechanical or hydraulic presses are used as shown in fig. 7.3, in case of serial production so that force can be continuously and gradually applied.

For the mounting of bearings with clearance fit into the housing or on the shaft, the ring with transition or tight fit should be mounted first, after which the shaft-bearing assembly will be mounted into the housing as shown in fig. 7.4, a and b.

In case of dismountable bearings, rings can be mounted separately - fig. 7.5, even if a tight fit is required for both rings.

The mounting of medium ( $d > 50 \text{ mm}$ ) and large-sized bearings with tight fit, requires much greater pressing forces. That's why in this case heating of bearings up to  $+80^{\circ}\text{C} \dots +110^{\circ}\text{C}$  should be used instead of pressing, excepting shielded bearings, 2Z (2ZR) type and sealed bearings, 2RS (2RSR) type.

For the bearings heating, oil bath, electric range, heating device with thermic ring or induction heating device etc. can be used as shown in fig. 7.6, a-d.

The device with thermic ring - fig. 7.6 c consists of a split aluminum ring with three grips and cuts which

b  
Fig. 7.3

b  
Fig. 7.4

make it be elastic.

Thermic ring bore diameter is equal to inner ring raceway diameter of dismountable bearings.

The ring outside diameter can be calculated using the equation:

$$D_{ex} = \sqrt{4d_1^2 - 3d^2}$$

Fig. 7.5

where:

- $D_{ex}$  = outside diameter of the thermic ring, mm
- $d_1$  = diameter of the inner ring raceway, mm
- $d$  = bearing bore diameter, mm

The mass of the thermic ring is approximately equal to the mass of the bearing inner ring.

In case of large-sized cylindrical roller bearings, heating is done with induction devices. These devices consist of a coil inductor, thermal relays for temperature adjustment and timers. 380 V voltage and 50 - 60 Hz frequency inductors are used for bearings with bore diameter up to 200 mm.

For larger sized bearings, 20... 40 V voltage and 50 - 60 Hz inductors are used.

This device is schematically shown in fig. 7.6 d.

## Mounting of bearings with tapered bore

Tapered bore bearings can be mounted directly on the shaft, on adapter sleeve or withdrawal sleeve. These bearings should always be mounted only with a tight fit. The tight fit can be done by an axial displacement of the bearing inner ring which

Fig. 7.6

is mounted directly on the tapered spindle of the shaft or by an axial displacement of the adapter or withdrawal sleeve.

The values of reduction in radial clearance are given in tables 7.1 and 7.2, as function of axial displacement on shaft of self-aligning ball bearings and spherical roller thrust bearings. After mounting the initial radial clearance is to be considered.

After mounting, radial clearance of radial and self-aligning ball bearings are in accordance with table 7.1.

The values of tightening are estimated by the values of the radial clearance reduction or of axial displacement. Axial displacement of the mounted bearings is measured by means of a limit gauge, as shown in fig. 7.7, a and b. The thickness of the limit gauge can be calculated from:

$$m = S - a$$

where:

m = thickness of the limit gauge, mm

S = distance initially measured, mm

a = axial displacement, from table 7.1, mm

**Values for spherical roller bearings radial clearance, after mounting**

Fig. 7.7

**Example**

A bearing 22252,  $d = 260$  mm, taper: 1:12, distance  $S = 10$  mm, distance "a" from table 7.1 = 1,90 mm,  $m = 10 - 1,9 = 8,10$  mm

Small-sized bearings with tapered bore which are to be mounted directly on the shaft or with adapter or withdrawal sleeves can be axially displaced by means of a nut as shown in fig. 7.8, a, or by means of a special sleeve as in fig. 7.8 b, c.

Fig. 7.8

Fig. 7.9

Fig. 7.10

a

b

Fig. 7.11

Fig. 7.12

Medium-sized bearings can be axially displaced by means of a special nut as shown in fig. 7.9 and some screws. Then, the nut is to be dismantled and replaced with a nut for axial fastening. Special hydraulic presses - fig. 7.11 are used to mount medium and large-sized bearings.

To reduce the bearing displacing force in case of large-sized bearings, pressurized oil is to be introduced between the tapered surfaces of the shaft spindle, bearing and b, by means of oil pump - fig. 7.10 or oil injector - fig. 7.12.

One or more grooves, should be provided as shown in fig. 7.13, a and b so that oil can be distributed between the mounting surfaces.

a

b

Fig. 7.13

## Bearing dismounting

When bearings with tapered bore are to be dismounted from the shaft or housing, the succession of operations is inversely done than in case of mounting.

Thus, the assembly mounted with clearance fit or small tightening is to be dismounted first and then the parts mounted with greater tightening, as shown in fig. 7.14 and fig. 7.15.

Fig. 7.14

Fig. 7.15

a

b

c

Fig. 7.16

To use mechanical or hydraulic instruments, when dismounting bearings, a special design of the shaft and housing is required, as shown in fig. 7.16, a-c: withdrawal grooves (a) and (b), threaded bores (c), grooves for oil distribution, fig. 7.13.

Medium and small-sized bearings which are mounted with a tight fit are dismounted from the shaft by means of a soft steel or copper mandrel or by means of mechanical or hydraulic presses fig.7.17, a-c.

a

b

c

Fig. 7.17

To reduce the frictional force when dismounting large sized bearings which were mounted on shaft with tight fit, pressurized oil should be introduced, as in case of mounting - fig. 7.11.

To dismount bearings with tapered bore which were mounted directly on the shaft or bearings which were mounted with withdrawal or adapter sleeves, the nut axially fastened should be first stripped. Then, dismounting is to be done by light hammering on the inner ring by means of a soft steel or copper mandrel, as shown in fig. 7.18 a and b.

In case of bearings mounted with withdrawal sleeves, a nut is to be screwed up to the threaded

part provided for this purpose, as shown in fig. 7.19, a and b.

In case of large-sized bearings, hydraulic devices are used as in case of mounting.

Some solutions for dismounting bearings with tapered bore mounted directly on the shaft spindle, with adapter or withdrawal sleeve are given in fig. 7.20, a and b.

## DEEP GROOVE BALL BEARINGS

## Deep groove ball bearings

Deep groove ball bearings are manufactured in a varied range, both of standard design and various constructive versions.

Deep groove ball bearings can take double direction radial and axial loads and also allow good operation at high speeds.

For these reasons, they can be widely used. Therefore, single row deep groove ball bearings are manufactured in many constructive versions as shown below.

Besides deep groove ball bearings of basic design, bearings with UG design, with grooves on the outer ring and WL design, with grooves on both rings are also used for the purpose of mounting seals or shields on the bearings 2ZR, 2RSR or 2RS type, as shown in the below figure.

### Suffixes

- A** - bearing with extended outer ring
- B** - bearing with extended inner ring
- C2** - radial clearance smaller than normal
- C3** - radial clearance larger than normal
- FA** - machined cage of steel or cast iron guided in the outer ring
- F2** - constructive modifications

- K** - bearing with tapered bore
- M** - machined cage of brass guided on the rolling elements
- MA** - machined cage of brass guided in the outer ring
- MB** - machined cage of brass guided on the inner ring
- N** - circular groove for snap ring on the outer ring
- NR** - circular groove on the outer ring and snap ring
- P0** - normal tolerance class (it is not marked)
- P6** - tolerance class more accurate than normal
- P63** - tolerance class P6 and radial clearance C3
- P5** - tolerance class more accurate than P6
- P4** - tolerance class more accurate than P5
- R** - rib on the outer ring
- RS** - bearing with seal on the side, with friction on the inner ring recess
- RSA** - bearing with special seal

- 2RS** - bearing with 2 seals, friction on the inner ring recess
- RSR** - bearing with seal on one side, friction on the rib of the inner ring
- 2RSR** - bearing with 2 seals, friction on the rib of the inner ring
- S0** - bearing which can operate up to a temperature of +150°C
- S1** - bearing which can operate up to a temperature of +200°C
- SP** - snap ring, diameter series 0, 2, 3, 4
- SR** - snap ring, diameter series 18 and 19
- T30** - bearing which can operate up to a temperature of +300°C, radial clearance 0,20...0,25 mm; phosphate-treated surfaces
- TN** - polyamide cage
- V** - bearing without cage
- Z** - bearing with shield and recess on the inner ring
- ZZ** - bearing with 2 shields and recess on the inner ring
- ZNRB** - bearing with shield and snap ring on the same side
- ZR** - bearing with shield, without recess on the inner ring
- 2ZR** - bearing with 2 shields, without recess on the inner ring

## Sealed and shielded deep groove ball bearings

URB manufactures two versions of sealed and shielded bearings, namely:

- bearings RS and Z type, with recess on the inner ring for sealing or shielding.
- bearings RSR and ZR type, when shielding and sealing respectively are done directly on the outside surface of the inner ring.

In case of bearings with non-rubbing shields, there is a small interstice between the shield and the rib of the inner ring; in case of bearings with seals, the gasoline and oil resistant elastic rubber lip rubs on the groove on the inner ring side or directly on the outside surface.

Bearings sealed and shielded on both sides manufactured in series are delivered filled with

lithium base grease and used at temperatures between -30°C and +110°C, in accordance with the specifications in chapter **Bearing lubrication**. Bearings can also be greased with special greases, relubrication not being necessary. Washing or heating are not allowed before bearing mounting in the assembly.

Bearings with shields have been designed first of all for cases when the inner ring rotates.

When the outer ring rotates, the lubricant can flow out of the bearing at a certain speed. In such cases, we recommend you to consult our experts.

## Deep groove ball bearings with the snap ring groove

Deep groove ball bearings, with snap ring groove on the outer ring can be located in the housing with snap rings.

Because of their simple and space saving mounting, these bearings simplify the assembly design. The groove for the snap ring and the snap rings are in accordance with ISO 464 and tables 7 and 8 respectively.

## Paired deep groove ball bearings

If the basic load of a single bearing is inadequate or the shaft has to be axially located in both directions with a certain clearance, paired deep groove ball bearings are recommended to be used.

These bearings can be delivered matched in pairs in three versions, as follows: DT (tandem arrangement), DB (back-to-back arrangement) or DF (face-to-face arrangement). They can be delivered with axial clearance or preloaded. The values of clearance or preload are given in table 2.

The producer marks "V" on the bearing outside surface as shown in next figure, so that paired bearings to be correctly mounted.

The multiple speed limit of these bearings can be calculated multiplying the speed of the basic bearing by 0,8.

Paired bearings are packed and delivered in the same box.

## Dimensions

The overall dimensions of deep groove ball bearings are in accordance with the stipulations of ISO 15.

## Misalignments

Deep groove ball bearings have limited abilities to compensate for bearing error of alignment. The permissible misalignment between the outer ring and the inner ring, which will not produce inadmissible high additional loads in the bearing, depends on the bearing size, operational radial clearance, inner bearing design and also on the magnitude of loads and moments acting upon the bearing.

Because of the complex relationship of these influence factors, definite and universally valid values of permissible misalignment cannot be determined. Considering the above mentioned factors, under normal operation conditions the permissible misalignments are between 2 and 10 minutes of arc, depending on the bearing series and load.

## Tolerances

Deep groove ball bearings are generally manufactured to the normal tolerance class P0.

At request, they can also be manufactured to the tolerance classes P6, P5 or P4.

The values of tolerances are given in chapter **Bearing tolerances** on page 26.

## Radial and axial clearance

Deep groove ball bearings are generally manufactured with normal radial clearance. At request, they can also be manufactured with radial clearance different from the normal one, according to ISO 5753. The values of radial clearance are given in table 1.

Paired bearings can be manufactured with axial clearance (suffix A) or preloaded (suffix L). Values for axial clearance and preload are given in table 2.

If a certain axial clearance is prescribed, this has to be measured and marked on the bearing by "A", followed by clearance actual value.

### Cages

Deep groove ball bearings are generally fitted with cages of pressed steel sheet.

Cages of glass fiber reinforced polyamide 6.6 are also suitable if the operating temperature doesn't exceed +120°C. They have reduced mass, low coefficient of friction and are noiseless in operation. Large-sized bearings are fitted with machined brass cages.

Cage design and some technical data are given in table 3.

## Bearing minimum radial load

A minimum load must be applied on a deep groove ball bearing so that they can operate correctly, especially in case of operating under heavy loads.

The forces of inertia which occur in bearing as well as the friction in lubricant influence negatively the operating conditions and can cause detrimental sliding movements between balls and raceways.

Table 3

Cage	Design		Application	Max. value	
	bearing	cage		D <sub>m</sub> n	
				oil	grease
Pressed cage of sheet with fins			<ul style="list-style-type: none"> <li>- General application</li> <li>- Bearings with d &gt; 10 mm</li> <li>- Low frictional moment</li> <li>- Low inertia</li> <li>- Moderate speeds</li> </ul>	100x10 <sup>3</sup>	550x10 <sup>3</sup>
Pressed cage of riveted sheet			<ul style="list-style-type: none"> <li>- General application</li> <li>- Bearings with d &gt; 10 mm</li> <li>- Low frictional moment</li> <li>- Low inertia</li> <li>- Moderate speeds</li> </ul>	1000x10 <sup>3</sup>	550x10 <sup>3</sup>
Polyamide cage			<ul style="list-style-type: none"> <li>- General application</li> <li>- Low frictional</li> <li>- High speeds</li> </ul>	1400x10 <sup>3</sup>	1100x10 <sup>3</sup>
Brass machined cage			<ul style="list-style-type: none"> <li>- General application</li> <li>- Bearings:</li> <li>61836-618/1400</li> <li>61936-619/950</li> <li>16036-16072</li> <li>6030-60/630</li> <li>6230-6248</li> <li>6320-6330</li> </ul>	1000x10 <sup>3</sup>	800x10 <sup>3</sup>

Minimum radial load depends on the bearing size, speed and lubricant viscosity at operating temperature. It can be roughly calculated from the equation:

$$F_{r \min} = 0,01 C_r, (C_r = \text{basic dynamic radial load}).$$

## Equivalent dynamic radial load

Deep groove ball bearing can take also radial and axial combined loads.

For deep groove ball bearings, single or paired in tandem arrangement DT, equivalent dynamic radial load can be calculated using the equation:

$$P_r = F_r, \text{ kN, when } F_a/F_r < e$$

$$P_r = XF_r + YF_a, \text{ kN, when } F_a/F_r > e$$

The greater the axial load, the greater the contact angle of these bearings.

Factor e, X and Y depend on the ratio  $f_0 F_a / C_{0r}$ .

Factor  $f_0$  can be determined using the diagram in the bellow figure, as a function of dimension series and mean diameter  $(d+D)/2$ .  $F_a$  is the axial and  $C_{0r}$  is the static basic load of the bearing.

The values of factors e, X, Y which depend on the bearing clearance can be determined from table 4, corresponding to the values of the ratio  $f_0 F_a / C_{0r}$ . The values in table 4 apply to bearings mounted with normal fit, i.e. shaft manufactured to tolerance class j5 or k5 and housing in J6, respectively.

Calculation factors e, X and Z for deep groove ball bearings, single mounted or matched in tandem

Table 4

$f_0 F_a / C_{0r}$	Normal radial clearance			Radial clearance C3			Radial clearance C4		
	e	X	Y	e	X	Y	e	X	Y
<b>0,2</b>	0,19	0,56	2,25	0,32	0,46	1,77	0,38	0,44	1,44
<b>0,4</b>	0,22	0,56	1,95	0,34	0,46	1,63	0,42	0,44	1,36
<b>0,8</b>	0,26	0,56	1,68	0,38	0,46	1,44	0,45	0,44	1,25
<b>1,6</b>	0,31	0,56	1,4	0,43	0,46	1,27	0,48	0,44	1,16
<b>3</b>	0,37	0,56	1,2	0,48	0,46	1,14	0,52	0,44	1,08
<b>6</b>	0,44	0,56	1,02	0,54	0,46	1	0,56	0,44	1

For bearings matched in DB or DT arrangement, equivalent dynamic radial load can be calculated using the equation:

$$P_r = F_r + Y_1 F_a, \text{ kN when } F_a/F_r < e$$

$$P_r = 0,75 F_r + Y_2 F_a, \text{ kN when } F_a/F_r > e.$$

The values of factors  $e$ ,  $Y_1$  and  $Y_2$ , as functions of ratio  $F_a/C_{0r}$  are given in table 5.

$f_0 F_a/C_{0r}$	$e$	$Y_1$	$Y_2$
<b>0,03</b>	0,32	2	2,8
<b>0,1</b>	0,4	1,55	2,2
<b>0,25</b>	0,47	3	1,65

## Equivalent static radial load

For deep groove ball bearings, single or matched in tandem (DT), equivalent static load can be calculated using the equations:

$$P_0 = F_r, \text{ kN, when } F_a/F_r < 0,8$$

$$P_0 = 0,6 F_r + 0,5 F_a, \text{ kN, when } F_a/F_r > 0,8$$

For bearings matched in DB or DF arrangement, it can be calculated from

$$P_0 = F_r + 1,7 F_a, \text{ kN.}$$

## Axial load

If deep groove ball bearings are pure axial loaded, the axial load should not exceed  $0,5 C_{0r}$ . In case of small-sized bearings and bearings of light series (diameter series 8, 9, 0 and 1), the axial load should not exceed  $0,25 C_{0r}$ .

Heavy axial loads cause a significant decrease of bearing rating life. In such cases, we recommend you to consult our experts.

## Abutment dimensions

For a proper location of bearing rings on the shaft shoulder and housing, respectively, maximum shaft (housing) connection radius  $r_u \text{ max}$  should be less than minimum bearing mounting chamfer  $r_s \text{ min}$ .

The shoulder should have the proper height corresponding to maximum bearing mounting chamfer.

The values of the connection radius ( $r_u$ ) and support shoulder height ( $h_u$ ) as function of mounting chamfers are given in table 6.

$r_s \text{ min}$	$r_u \text{ max}$	$h_u \text{ min}$

The outer ring chamfer on the side of snap ring groove should allow a housing connection radius of:  
 0,3 mm for dimensions series 18, up to D = 78 mm included and for dimensions series 19, up to D = 47 mm included;  
 0,5 mm for dimensions series 18, for D > 78 mm and for dimensions series 19, for D > 47 mm

# Double Row Deep Groove Ball Bearings

## Standards, Boundary dimensions

Standard plans	DIN 616
Deep groove ball bearing	DIN 625

## General

Double Row Deep groove ball bearings feature higher load ratings when compared to single row bearings.

This two row bearing gives a very rigid arrangement, but they are very sensitive to misalignments.

## Tolerances

**URB** Double Row Deep groove bearings are produced in normal tolerance class (**PN**) as standard.

## Internal clearance

**URB** Double Row Deep groove ball bearings are produced with **normal internal clearance, (CN)** as standard. Other internal clearance groups may be produced upon request.

## Design variants, Cages

**URB Double Row Deep groove ball bearings** have the latest design (suffix B) without filling slots.

Thus they are able to support thrust loads equally well in both directions. These bearings are fitted with **polyamide cages, (suffix TN)** as standard.

These bearing sizes are also available with **pressed steel cages.**

But, it must be considered that some of these bearings may have filling slots which limit the ability to support thrust loads in the direction of these filling slots.

Deep groove ball bearings

## SELF-ALIGNING BALL BEARINGS

# Self-aligning ball bearings

Self-aligning ball bearings have a common sphered raceway in the outer ring. This feature allows angular misalignment of the shaft relative to the housing. Therefore self-aligning ball bearings are particularly used in case of bearings where misalignment can occur from errors in mounting or from shaft bending.

Double row self-aligning ball bearings are manufactured both with cylindrical bore and tapered bore (taper 1:12). Self-aligning bearings with tapered bore can be delivered, at request, with adapter sleeves.

### Suffixes

- C2** - radial clearance smaller than normal
- C3** - radial clearance larger than normal
- H** - adapter sleeve
- K** - tapered bore bearings
- M** - machined brass cage, ball guided
- MB** - machined brass cage, guided on the inner ring
- P6** - tolerance class more accurate than normal
- P63** - tolerance class P6 with radial clearance C3
- 2RSR** - bearing with two seals
- TN** - polyamide cage

### Sealed self-aligning ball bearings

Self-aligning ball bearings are also available in a sealed version with seals at both sides. The seals are made of gasoline, oil and wear-resistant synthetic rubber. Sealed bearings are delivered filled with a certain grease quantity. Sealed bearing operating temperatures are between -30°C and +80°C. Grease service life is much reduced if bearing

operates at a temperature higher than +80°C (see page 63).

Sealed bearings are greased for the entire operating period, relubrication not being necessary. Sealed bearings washing or heating before mounting in assembly is not allowed.

### Self-aligning ball bearings with extended inner ring

Self-aligning ball bearings with extended inner ring of series 112 and 113 are used in applications where high accuracy is not necessary and generally, they can be mounted directly on rolled shafts. The bore manufactured to tolerance class J7 allows fast mounting and dismounting. The inner ring has a groove for bearing axial location which can be done by means of a screw or pin.

### Dimensions

Overall dimensions of self-aligning ball bearings are in accordance with ISO 15.

### Misalignment

Self-aligning ball bearings allow within certain limits an angular misalignment of the outer ring in relation to the inner ring, without detrimental effects in bearing unit.

Approximate values for permissible misalignment, under normal operating conditions are given in table 1.

Permissible misalignment	
Bearing series	Permissible misalignment
	degrees
108, 126, 127, 129, 135	3
12, 112	2,5
13, 113	3
22	2,5
22-2RSR	1,5
23	3
23-2RSR	1,5

### Tolerances and radial clearance

Bearings of serial production are manufactured to normal tolerance class and with normal radial clearance. Tapered bore bearings of serial production are also manufactured with radial clearance C3.

Self-aligning ball bearings with extended inner ring are manufactured with radial clearance C2 and normal clearance.

At request, these bearings can also be manufactured to other tolerance classes and with smaller or larger radial clearance.

The bore of self-aligning ball bearings with extended inner ring is manufactured to tolerance class J7.

Bearing tolerances are given on page 27 and the values of radial clearance are given in tables 2 and 3.

## Equivalent dynamic radial load

$$P_r = F_r + Y_1 F_a, \text{ kN,} \quad \text{when } F_a/F_r \leq e,$$

$$P_r = 0,65 F_r + Y_2 F_a, \text{ kN} \quad \text{when } F_a/F_r > e,$$

The values of factors  $e$ ,  $Y_1$  and  $Y_2$  which depend on bearings are given in bearing tables.

## Equivalent static radial load

$$P_{0r} = F_r + Y_0 F_a, \text{ kN}$$

The values of the factor  $Y_0$  which depends on bearing are given in bearing tables.

## Axial load on bearings with adapter sleeves

If self-aligning ball bearings are mounted with adapter sleeves on smooth shafts, without side location, their axial carrying capacity depends on the friction between the sleeve bore and shaft.

Permissible axial load can be precisely enough determined using the equation:

$$F_{a \max} = 3 B d,$$

where:

$F_{a \max}$  - maximum permissible axial load, N

$B$  - bearing width, mm

$d$  - bearing bore diameter, mm

## Cages

Self-aligning ball bearings are generally fitted with presses cages of sheet. At special request, when bearings operate under fluctuating loads, at high speeds and where large sizes are required, machined brass cages are recommended to be used. Glass fiber reinforced polyamide 6.6 cages are also suitable if the operating temperatures do not exceed +120°C. They have low mass, a low coefficient of friction and are noiseless while running.

Cage design and technical data are given in table 4.

Cage	Design		Application	Max. value $D_m$	
	bearing	cage		oil	grease
Pressed sheet cage			- General application - Moderate speeds - Sealed bearings series 12, 13, 22, 23	600x10 <sup>3</sup>	450x10 <sup>3</sup>
Pressed sheet cage			- General application - Moderate speeds - Bearings series 22, 23	600x10 <sup>3</sup>	450x10 <sup>3</sup>
Polyamide cage TN			- High speeds - Bearings series 12, 13, 22, 23	1000x10 <sup>3</sup>	800x10 <sup>3</sup>
Machined brass cage M			- High speeds - Bearings: 1220-1222; 1317-1322; 2217-2222; 2317-2320	900x10 <sup>3</sup>	700x10 <sup>3</sup>

### Special characteristics

In case of some dimensions of self-aligning ball bearings series 12 and 13, the balls protrude somewhat from the bearing, as shown in the adjacent design and table. This should be considered both by designer and user.

**Values of dimension S**

Table 5

Bearing	S mm
1224	1,3
1226	0,7
1318	1
1319	1,5
1320	2,5
1321	2,6
1322	2,6

**Abutment dimensions**

Table 6

$r_s$ min.	$r_u$ max.	$h_{u\min}$ min.
		Bearing series 12, 13, 112, 22, 23, 113
mm		
0,3	0,2	1,2
0,6	0,6	2,1
1	1	2,8
1,1	1	3,5
1,5	1,5	4,5
2	2	5,5
2,1	2,1	6

### Abutment dimensions

For a proper location of bearing rings on the shaft shoulder and housing shoulder respectively, maximum connection radius  $r_{u\max}$  of shaft (housing) should be less than minimum mounting chamfer  $r_{s\min}$  of bearing.

Shoulder height should also be properly sized in case of bearing maximum mounting chamfer.

In case of self-aligning ball bearings with tapered bore which are mounted directly on a tapered shaft or with an adapter sleeve, proper tightening and minimum radial clearance of 10-20  $\mu\text{m}$  should be assured for normal clearance and of 20-55  $\mu\text{m}$  for clearance C3, depending on bearing size and series. The values of the connection radius and support shoulder height are given in table 6 and mounting dimensions for bearings mounted with adapter sleeves are given in table 7.

## ANGULAR CONTACT BALL BEARINGS

# Angular contact ball bearings, single row

Single row angular contact bearings are manufactured in various constructive versions, with various contact angles, depending on the application. Bearings series 72B and 73B for general applications have a contact angle  $\alpha = 40^\circ$ . Bearings series 718, 719, 70 and 72 generally used for tool-holders, have

phenol resins (textolite) cages or machined brass cages. Those with bore diameters up to  $d = 100 \text{ mm}$  are manufactured to tolerance classes P5, P4 and P2 and have a contact angle of  $15^\circ(\text{C})$  and  $25^\circ(\text{A})$  respectively.

Series 72B, 73B  
Contact angle  $\alpha = 40^\circ$

Series 70A, 72A  
Contact angle  $\alpha = 25^\circ$

Series 70C, 72C  
Contact angle  $\alpha = 15^\circ$

DT arrangement (Tandem)

DB arrangement  
(Back-to-back)

DF arrangement  
(Face-to-face)

TFT arrangement

TBT arrangement

QFC arrangement

## Suffixes

- A** - bearing with extended outer ring
- A** - bearing with contact angle  $\alpha = 25^\circ$
- B** - bearing with extended outer ring
- B** - bearing with contact angle  $\alpha = 40^\circ$
- BB** - bearing with  $\alpha = 40^\circ$  and extended inner ring
- C** - bearing with contact angle  $\alpha = 15^\circ$
- CA** - bearing with radial clearance smaller than normal
- CB** - bearing with normal radial clearance
- CC** - radial bearing with axial clearance larger than normal
- D** - two bearings set D - bearing with two-pieces inner ring
- DB** - two bearings set in back-to-back arrangement, (O)
- DF** - two bearings set in face-to-face arrangement, (X)
- DT** - two bearings set in tandem arrangement
- E** - bearing with contact angle  $\alpha = 20^\circ$
- FA** - bearing with machined cage of steel or cast iron, guided in the outer ring
- FB** - bearing with machined cage of steel or cast iron, guided on the inner ring
- GA** - light preload, bearings series 72B, 73B
- GB** - moderate preload, bearings series 72B, 73B
- GC** - heavy preload, bearings series 72B, 73B
- L** - light preload, bearings series 70C, 70A, 72A
- M** - moderate preload, bearings series 70C, 70A, 72A
- M** - machined brass cage, ball guided
- MA** - machined brass cage, guided in the outer ring
- MB** - machined brass cage, guided in the inner ring
- O** - bearing set without axial clearance
- P0** - normal tolerance class
- P6** - tolerance class more accurate than normal
- P5** - tolerance class more accurate than P6
- P4** - tolerance class more accurate than P5
- P2** - tolerance class more accurate than P4
- Q** - four bearings set
- QFC** - tandem pairs in X arrangement
- S** - heavy preload, bearings series 70C, 70A, 72A
- SO** - bearings operating up to a temperature of + 150°C

- S1** - bearings operating up to a temperature of + 200°C
- T** - three bearings set
- T** - bearing set total width (T168, T200)
- TBT** - three bearings set in O arrangement, plus T
- TFT** - three bearings set in X arrangement, plus T
- TN** - polyamide cage
- V** - full complement bearing
- U** - bearings of universal design, with deviations of  $d$  and  $D$  and  $K_1$ ,  $K_0$  in P2 class
- UA** - bearings with small axial clearance at DB and DF arrangements
- UL** - bearings with light preload at DB and DF arrangements
- UO** - bearings without small axial clearance at DB and DF arrangements
- UP** - tolerance class with deviations of  $d$  and  $D$  in P4 class and of  $K_1$  and  $K_0$  in P2 class.

Single row angular contact ball bearings can take only one direction axial loads. When being radially loaded, in bearing occurs an axially acting load which has to be compensated.

For this reason, a bearing or paired bearings are mounted on each shaft end.

Single row angular contact ball bearings with B suffix have a contact angle  $\alpha = 40^\circ$  and are suitable in case of heavy loads.

These bearings are not dismountable and their use at relatively high speeds is allowed.

Pair mounting of bearings as shown in figures on page 133 is used when the load carrying capacity of a single bearing is inadequate (tandem arrangement), respectively when axial loads have to be taken in both directions (DB or DF arrangements).

In case of DT tandem arrangement, the contact lines are in parallel. Radial and axial loads are uniformly distributed on both bearings. The bearing pair can take axial loads in only one direction. Therefore, a third bearing should take axial loads in the opposite direction.

DB arrangement is considered to be a relatively stiff arrangement and can also take tilting moments.

The contact lines of DF arrangement converge

towards the bearing axis and form letter "X". Axial loads are taken in the same way as in case of DB arrangement, but the arrangement is not so stiff and it is less suitable for taking tilting moments.

## Universal design

Single row angular contact ball bearings of universal design are suitable for DB, DF and DT arrangements.

Bearings of universal design are manufactured to more accurate tolerance classes and can be matched if the mounting conditions UA, UO and UL are observed.

The values of clearance or preload are obtained when the shaft is manufactured to tolerance class J5 and the housing bore to tolerance class J6.

## Dimensions

Main dimensions of bearings given in tables are in accordance with ISO 15.

## Misalignment

In case of single row angular contact ball bearings the conditions regarding the permissible error of

alignment of the outer ring relative to the inner ring are as complex as for single row deep groove ball bearings.

When the bearings are paired in DB arrangement, angular misalignments of the outer ring in relation to the inner ring can only be accommodated between the balls and raceways by force, leading to a reduction in bearing life.

## Tolerances

Single row angular contact ball bearings of series 72B and 73B, with a contact angle  $\alpha = 40^\circ$  (B) are generally manufactured to the normal tolerance class.

At request, they also can be manufactured to normal tolerance classes P6 and P5.

The deviations of bore diameter, outside diameter and width of high accuracy single row angular contact ball bearings of universal design (UL) are given in table 1.

In case of single row angular contact ball bearings manufactured and delivered in sets of 2, 3 or 4 bearings, outside and bore diameter should be chosen considering the mean tolerance values, which are given on the package.

Deviations of main dimensions of high accuracy row angular contact bearings

80	120	-5,5	-2			-3,5	-1,5	-380	0

## Contact angle

In case of single row angular contact ball bearings, the efforts between rings and rolling elements (contact points of rolling elements / outer or inner ring) are transmitted at an angle  $\alpha$  ( $< 90^\circ$ ) to a plane perpendicular to the bearing axis.

The value of this angle depends on the magnitude of the raceway radius, rolling element diameter and radial clearance in bearing, when the curvature centres of the raceway in the outer or in the inner ring are in the same plane.

**Axial clearance - preload**

Axial clearance or preload can be obtained only when single row angular contact ball bearings is mounted in the assembly and depends on the location of the second bearing which assures the shaft axial guiding.

Single row angular contact ball bearings series 72B and 73B, paired mounted in DB and DF arrangements are manufactured with normal axial clearance CB, smaller than normal, CA, larger than normal, CC, or with light preload, GA, moderate preload GB, or heavy preload, GC, according to the values given in table 2.

**Axial clearance or preload of single row angular contact ball bearings series 72B and 73B, pair mounted in DB or DF arrangements**

High accuracy single row angular contact ball bearings series 70C, 70A and 72A, with a contact angle  $\alpha = 15^\circ$  (C) and  $\alpha = 25^\circ$  (A), which are generally used for grinding stone holders, paired mounted in

DB and DF arrangement, are manufactured with an initial preload. It can be: light (L), moderate (M), heavy (S). The values of these preloads are given in table 3.

**Values of axial preload of bearings of series 70C, in DB and DF arrangements**

Designs of single row angular contact ball bearings with clearance or initial preload are given in the figures below:

Before mounting (preload)

After mounting (preload)

## Cages

Single row angular contact ball bearings series 72B and 73B are generally fitted with pressed sheet cages.

At special request (high speeds, large sizes), bearing series 70C, 72C, 70A and 72A are fitted

with machined brass cages. Cages of glass fibre reinforced polyamide 6.6 are also used with good results if operating temperature doesn't exceed +120°C.

Cages design and some technical data are given in table 4.

Cage design and technical data <span style="float: right;">Table 4</span>

### Equivalent dynamic radial load

For single row angular contact ball bearings series 72B and 73B, single and in tandem arrangement the following equations are used:

$$P_r = F_r, \text{ kN}, \quad \text{when } F_a/F_r < 1,14,$$

$$P_r = 0,35 F_r + 0,57 F_a, \text{ kN}, \quad \text{when } F_a/F_r > 1,14$$

For bearings in DB or DF arrangement

$$P_r = F_r + 0,65 F_a, \text{ kN} \quad \text{when } F_a/F_r < 1,14$$

$$P_r = 0,57 F_r + 0,93 F_a, \text{ kN}, \quad \text{when } F_a/F_r > 1,14$$

In case of paired bearings,  $F_r$  and  $F_a$  are the loads acting upon the bearings pair.

As the load is transmitted from one raceway to the other under a certain angle to the bearings axis, the actual load will cause an axial load. This has to be considered when calculating the equivalent dynamic load, in case of two single bearings or tandem

arrangements. The equations needed for calculation are given in table 5, for various arrangements and loading versions.

These equations are available for bearings mounted without clearance and without preload (clearance equal to zero).

For single row angular contact ball bearings series 70C and 72C with a contact angle  $\alpha = 15^\circ$  (C), single or in DT arrangement, the following equations are available:

$$P_r = F_r, \text{ kN}, \quad \text{for } F_a/F_r < e,$$

$$P_r = 0,44 F_r + Y F_a, \text{ kN}, \quad \text{for } F_a/F_r > e$$

The values of factor Y depend on the values of the ratio  $f_0 i F_a / C_{Or}$  and are given in table 6. Factor  $f_0$  can be found in diagram in page 140 as a function of dimensions series and bearing mean diameter. "i" represents the number of bearings or bearings pairs in a bearing join.

Back to back arrangement  
DB

Face to face arrangement  
DF

Back to back arrangement  
DB

Face to face arrangement  
DF

For bearings in DB and DF arrangements, the following equations are available:

$$P_r = F_r + Y_1 F_a, \text{ kN, for } F_a/F_r < e,$$

$$P_r = 0,72 F_r + Y_2 F_a, \text{ kN, for } F_a/F_r > e$$

The values of factors  $Y_1$  and  $Y_2$  depend on the ratio  $f_0 i F_a / C_{Or}$  and are given in table 6 ( $f_0$  from diagram below).

Determination of axial loads

Table 5

Loading version	Axial load
1a) $F_{rA} \geq F_{rB}$ $K_a \geq 0$	$F_{aA} = 1,14 F_{rA}$ $F_{aB} = F_{aA} + K_a$
1b) $F_{rA} < F_{rB}$ $K_a \geq 1,14 (F_{rB} - F_{rA})$	$F_{aA} = 1,14 F_{rA}$ $F_{aB} = F_{aA} + K_a$
1c) $F_{rA} < F_{rB}$ $K_a \leq 1,14 (F_{rB} - F_{rA})$	$F_{aB} = F_{aB} - K_a$ $F_{aB} = 1,14 F_{rB}$
2a) $F_{rA} \leq F_{rB}$ $K_a \geq 0$	$F_{aB} = F_{aB} + K_a$ $F_{aB} = 1,14 F_{rB}$
2b) $F_{rA} > F_{rB}$ $K_a \geq 1,14 (F_{rA} - F_{rB})$	$F_{aB} = F_{aB} + K_a$ $F_{aB} = 1,14 F_{rB}$
2c) $F_{rA} > F_{rB}$ $K_a < 1,14 (F_{rA} - F_{rB})$	$F_{aA} = 1,14 F_{rA}$ $F_{aB} = F_{aA} - K_a$

For single row angular contact ball bearings series 70A and 72A, with a contact angle  $\alpha = 25^\circ$ , single or in DT arrangement, the following equation are available:

$$P_r = F_r, \text{ kN, for } F_a/F_r < 0,68$$

$$P_r = 0,41 F_r + 0,87 F_a, \text{ kN, for } F_a/F_r > 0,68$$

For bearings in DB and DF arrangement, the following equations are available:

$$P_r = F_r + Y_1 F_a, \text{ kN, for } F_a/F_r < e$$

$$P_r = 0,72 F_r + Y_2 F_a, \text{ kN, for } F_a/F_r > e$$

Values for  $Y_1$  and  $Y_2$  are given in table 6.

	Single and DT		Arrangement DB or DF	
	e	Y	Y <sub>1</sub>	Y <sub>2</sub>
<b>0,2</b>	0,38	1,46	1,64	2,37
<b>0,4</b>	0,41	1,36	1,52	2,21
<b>0,8</b>	0,44	1,28	1,44	2,11
<b>1,6</b>	0,48	1,16	1,31	1,90
<b>3</b>	0,52	1,08	1,21	1,78
<b>6</b>	0,56	1	1,12	1,66

### Equivalent static load

For single row angular contact ball bearings series 72B and 73B with a contact angle  $\alpha = 40^\circ$ , single and in DT arrangement, the following equation is available:

$$P_{or} = 0,6 F_r + 0,26 F_a, \text{ kN}$$

If  $P_{or} < F$  then we consider  $P_0 = F_r$

For bearings in DB and DT arrangement, the following equation is available:

$$P_{or} = F_r + 0,52 F_a, \text{ kN}$$

For single row angular contact ball bearings series

70C and 72C, with a contact angle  $\alpha = 15^\circ$ , single and in DT arrangement, the following equation is available:

$$P_{or} = 0,5 F_r + 0,46 F_a, \text{ kN}$$

For bearings in DB and DF arrangement, the following equation is available:

$$P_{or} = 0,5 F_r + 0,92 F_a, \text{ kN}$$

For single row angular contact ball bearings series 70A and 72A with a contact angle  $\alpha = 25^\circ$ , single and in DT arrangement, the following equation is available:

$$P_{or} = 0,5 F_r + 0,38 F_a, \text{ kN}$$

For bearings in DB and DF arrangement, the following equation is available:

$$P_{or} = F_r + 0,76 F_a, \text{ kN}$$

Two "V" scratches are marked on the outside surface where the runout is maximum, i.e. where the outer ring thickness is maximum, so that the bearings of a set can be mounted in the manufacturing order. The place of maximum runout is marked on the chamfer between the inner ring bore and side face. Thus, the possible fit ovalnesses on the shaft can be compensated.

Every set is delivered as an unit, separately packed. In each unit, bearings are singly packed.

If distance rings are necessary to be mounted between bearings, they have not to be adjusted when being mounted. There is only one condition to be observed: the inner distance ring width should be equal to that of the outer ring, the side faces being parallel to each other. This can be easily done if both distance rings are simultaneously ground on a grinding and lapping machine. If bearings are mounted with distance rings, the mounting is also done observing the "V" marked as mentioned above. The cone vertex should be on the ring side opposite to that one on which the load acts (see next figure).

## Basic dynamic load of paired bearings

Basic dynamic load given in bearings tables is valid for each single bearing. Basic dynamic load of a paired bearings set can be determined according to the specifications on page 20-21.

## Basic static load of paired bearings

Basic static load of paired bearings can be similarly determined, multiplying the values of CO<sub>r</sub> in the tables by 2, 3 and 4 respectively.

## Bearing speed limit

Single row angular contact ball bearings are used at high speeds.

The values of speeds for bearings series 72B and 73B, normal tolerance class, without preload are given in this catalogue.

In case of preloaded bearings, for single mounted bearing and bearings in DB, DF or DT arrangements, speed should be multiplied by the coefficients in table 7.

For bearings series 70C, 72C, 70A and 72A, speeds are given for the tolerance class P4 and light preload.

In case of bearings with other values of preloads or arrangements of 3 or 4 bearing sets, the speeds of the bearing of basic design should be multiplied by the values of the coefficients in table 7.

Arrangement	Bearing preload			
	UA,UO	L	M	S
Single	1,0	1,0	0,90	0,80
Tandem, DT	0,90	0,90	0,80	0,65
Back-to-back, DB	0,80	0,80	0,70	0,55
Face-to-face, DF	0,80	0,75	0,60	0,40
Three bearings set	0,75	0,70	0,55	0,35
Four bearings set	0,70	0,65	0,45	0,25

## Abutment dimensions

For a proper location of bearing rings on the shaft and housing shoulder respectively, shaft (housing) maximum connection radius  $r_{u\max}$  should be less than bearing minimum mounting chamfer  $r_{1\min}, r_{2\min}$ .

Shoulder height should also be properly sized in case of bearing maximum mounting chamfer.

The values of the connection radii and support shoulder height are given in table 8.

$r_s, r_{1s}$ min	$r_s, r_{1s}$ max	$h_u, h_{u1}$ min

## TENSIONER BRAND CHT®

Chiaravalli Group SpA produces all its automatic tensioners in Italy. Our automatic tensioners keep the tension of the chains and the belts constant. Their automatic tension action improves the performances and increases the duration of the chains and the belts, thus reducing the maintenance on them. Furthermore, the tensioners can also be used as pressers, to keep any item in the desired position in movement on the transport band lines.

The incorporated spring mechanism acts as damper, by absorbing the overloaded and reducing the vibrations.

The reliability and noiseless of our tensioners is possible thanks to the self-lubricating bushing in PTFE and T line rotating tensioner thanks to the sintered bronze bushings.

The tensioners are available in a wide variety of models and sizes, they are used in several applications such as agricultural machines, conveyors bands, packaging, bottling and printing machines and industrial applications, where chains or belts are involved.

The high quality of the used materials and the accuracy of the items machining process, make our tensioners, higher quality products, with long-life, capable to withstand heavy loads in any environment. All tensioners with aluminum body/base are black painted through the cataphoresis process.

This process consist of the immersion of the parts with a continue electric current. The deposited film confers to the tensioners aesthetic and anticorrosive characteristics, then prolonging ther life time.

## CYLINDRICAL ROLLER BEARINGS

150

# Cylindrical roller bearings

Cylindrical roller bearings are manufactured in a various range of constructive types and sizes, particularly single row cylindrical roller bearings but also two or more row cylindrical roller bearings, with cages or roller by roller, as shown in the designs below.

In case of cylindrical roller bearings, the rollers are laterally guided by the fixed ribs of one ring.

In case of bearings with cages, the ring with ribs and the rollers retained in the cage can be drawn out from the other ring, which means that these bearings are dismountable.

Therefore, bearings from joints can be much easier mounted and dismantled, especially were interference fits are needed for both rings due to the loading conditions.

Bearings are provided with unloaded rollers at both generatrix ends. Therefore, the linear contact between rollers and rings alters advantageously, i.e. peripheral stresses are avoided.

## Suffixes

- AR** - Grinding addition on the inner ring raceway
- B** - Cylindrical roller bearings with extended inner ring
- C2** - Radial clearance smaller than normal, bearings with interchangeable elements
- C2NA** - Radial clearance smaller than normal, bearings with non-interchangeable elements
- C3** - Radial clearance larger than normal, bearings with interchangeable elements
- C3NA** - Radial clearance larger than normal, bearings with non-interchangeable elements

- D** - Two-pieces inner ring
- E** - Cylindrical roller bearings, E-design (increased basic static and dynamic loads)
- F** - Machined steel or special cast iron cage
- F2** - Constructive modification
- K** - Tapered bore bearing
- M** - Machined brass cage guided on the rolling elements
- M6** - Machined brass cage with integral rivets
- MA** - Machined brass cage guided in the outer ring
- MA6** - Machined brass cage with internal rivets guided on the outer ring
- MB** - Machined brass cage guided in the inner ring

- MPA** - Machined brass cage (one-piece)
- N** - Circular groove in the outer ring for snap ring
- NA** - Radial clearance, non-interchangeable elements
- NR** - Circular groove in the outer ring and snap ring
- P** - Two-pieces outer ring
- P5** - Tolerance class more accurate than normal (P6)
- P51** - Tolerance class P5 and radial clearance C1
- P53** - Tolerance class P5 and radial clearance C3
- P4** - Tolerance class more accurate than P5
- P41** - Tolerance class P4 and radial clearance C1
- R...** - Non-standardized radial clearance (e.g. R45...85)
- TN** - Polyamide cage
- V** - Roller bearing without cage (full complement)
- VH** - Self-retaining roller bearing without cage
- W20** - Lubrication holes in the outer ring
- W518** - Lubrication holes in the outer and inner ring
- W5** - Lubrication groove and holes in both rings
- W513** - Lubrication groove and holes in the outer ring and lubrication holes in the inner ring  
 $W513 = W33 + W26$
- W7** - Locating holes
- W8** - Lubrication groove on the outer ring side surfaces
- W9** - Lubrication groove on the inner ring side surfaces
- W20** - Lubrication holes in the outer ring
- W33** - Lubrication groove and holes on the outer ring
- W44** - Lubrication groove and holes on the inner ring
- W339** -  $W9 + W33$
- ZS** - NA radial clearance; changing the bearing elements, the clearance can be obtained from the interchangeable elements.

## Single or more rows cylindrical roller bearings

Single or more rows cylindrical roller bearings are manufactured by URB in various constructive versions, depending on the position of the ribs on

rings. The four basic designs (NU, NJ, N and NUP) are given in the bearing tables.

Bearings of NU design have two fixed ribs on the outer ring and one smooth inner ring. Bearings of N design have two fixed ribs on the inner ring and one smooth outer ring. These designs allow an axial displacement in certain limits, of the shaft in relation to the housing. Therefore, these rolling bearings are used in non-locating bearing units.

Bearings of NJ design have two fixed ribs on the outer ring and a fixed rib on the inner ring which can guide the shaft in a single direction (axially).

Bearings of NUP design have also two fixed ribs on the outer ring and, on the inner ring, a fixed rib and a support washer. This way they can be used as locating bearings, guiding the shaft axially in both directions.

For a shaft guiding in a single direction, it also can be used a bearing of NU design which is combined with a support washer. Thus, the constructive version NUJ is obtained.

Support washers on both sides of a bearing of NU design are not allowed as they lead to an axial blocking of the rollers.

Cylindrical roller bearings can carry heavy radial loads and can operate at high speeds.

Double or more rows cylindrical roller bearings have small sections, high load carrying capacity and stiffness.

These bearings provide high stiffness and maximum load carrying capacity and are particularly used for tool holders of the machine- tools and rolling mills.

Double row cylindrical roller bearings series NNU49 and NN30 are generally manufactured to tolerance classes P5 and SP, used for machine tools.

Large-sized bearings series NNU49 are also manufactured to the normal tolerance class.

## Cylindrical roller bearings with snap ring groove

Single row cylindrical roller bearings are also manufactured with snap ring grooves on the outer

rings. This design simplifies the bearing joint as the bearings are located into the housing by means of the snap rings. The snap ring groove and snap rings are in accordance with ISO 464, and tables 7 and 8 on page 90 and 92.

## Cylindrical roller bearings without cage (full complement)

These bearings incorporate the maximum number of rollers and have a small section in relation to their width.

This provides a high load carrying capacity and allows space-saving designs to be achieved.

Cylindrical roller bearings without cage cannot be used at speeds as high as those with cages. These bearings are manufactured with single or more row rollers and suffix V is added to the bearing designation. The most utilized bearings are those of series NCF29 V, NCF30 V and NJ23 VH and they are given in this catalogue on page 210.

## Dimensions

The main dimensions of standardized bearings given in tables are in accordance with ISO15.

## Misalignment

The modified contact between rollers and raceway allows not only peripheral stresses to be avoided but also, in case of single row roller bearings, permits an angular misalignment of the outer ring with respect to the inner ring, depending on the bearing series and load according to the table 1.

Bearings series	Permissible misalignment

1) Radial clearance for bearings with tapered bore is staggered with one group to the right, for example radial clearance C3 for cylindrical bore bearing match Normal radial clearance for tapered bore bearings.

**Tolerances and radial clearance**

Single row cylindrical roller bearings are usually manufactured to normal tolerance class with normal radial clearance. They can also be manufactured to more accurate tolerance classes and with larger (C3NA and C4NA) or smaller (C1NA and C2NA) radial clearances.

Tolerances of cylindrical roller bearings are given on pages 28.

Radial clearances according to international standard ISO 5753 are given in tables 2 and 3 for cylindrical bore bearings both with interchangeable rings and with non-interchangeable rings (NA).

**Cages**

Small and medium-sized single row cylindrical roller bearings are generally fitted with pressed sheet cages. Large-sized bearings are fitted with machined brass cages of normal design, i.e. cages of separable design guided on rolling elements M, on the outside surface MA or inner surface MB. In case of heavy loads and high speeds, cages are made in one piece.

Glass fiber reinforced polyamide 6.6 cages, are successfully used for small and medium-sized bearings, if the operating temperature doesn't exceed + 120°C. These cages have low mass, low coefficient of friction and are noiseless while running.

Cage design and some technical data are given in table 4.

<sup>1)</sup> Radial clearance for bearings with tapered bore is staggered with one group to the right, for example radial clearance C3NA for cylindrical bore bearings match radial clearance NA for tapered bore bearings.

## Minimum load

Cylindrical roller bearings must be subjected to a given minimum load, so that a proper operation of these bearings can be guaranteed.

This is necessary especially as the bearings are operated at high speeds and the centrifugal forces

produce additional friction in bearing due to the sliding between rollers and raceway.

The values of the minimum load can be enough accurately calculated using the equation:

$$F_{m} = 0,02 C_1, \text{ kN}$$

### Equivalent dynamic radial load

For cylindrical roller bearings purely radially loaded which don't locate shafts axially, equivalent dynamic load is:

$$P_r = F_r, \text{ kN}$$

If cylindrical roller bearings have ribs on the outer and inner rings and locate shafts axially in one or both directions, equivalent dynamic load can be calculated using the equations:

$$P_r = F_r, \text{ kN}, \quad \text{when } F_a/F_r \leq e$$

$$P_r = 0,92 F_r + Y F_a, \text{ kN}, \quad \text{when } F_a/F_r > e$$

Where:

- e - calculation factor with values:
  - 0,2 for series 10,2,3 and 4
  - 0,3 for series 22,23
- Y - factor for axial load
  - 0,6 for series 10,2,3 and 4
  - 0,4 for series 22,23

Cylindrical roller bearings axially loaded run satisfactorily only if they are simultaneously radially loaded. Ratio  $F_a/F_r$  should not exceed 0,5 for bearings of E design and 0,4 for the other bearings.

### Equivalent static radial load

For cylindrical roller bearings purely radially loaded, equivalent static load is:

$$P_{or} = F_r, \text{ kN}$$

### Dynamic axial load

Bearings with ribs on the outer ring can accommodate axial loads in addition to radial loads. The axial load carrying capacity of cylindrical roller bearings do not depend essentially on the steel fatigue strength, but on the resistance of the sliding surfaces at the roller end and rib contact and

therefore on lubrication, operating temperature and bearing thermal conductivity.

Considering the above mentioned, axial load carrying capacity of a cylindrical roller bearing can be enough accurately calculated using the following equation:

$$F_{a,max} = \frac{k_1 C_{0r} 10^4}{n(d + D)} - k_2 F_r,$$

where:

- $F_{a,max}$  - maximum permissible axial load, kN
- $C_{0r}$  - radial static load, kN
- $F_r$  - radial load component, kN
- n - operating speed, r/min
- d - bearing bore diameter, mm
- D - bearing outside diameter, mm
- $k_1$  - auxiliary factor, see table 5
- $k_2$  - auxiliary factor, see table 5

The above equation is based on conditions which are considered typical for normal bearing operation:

- a difference of 60°C between the bearing operating temperature and the ambient temperature
- a specific heat loss from the bearing of 0,5 mW/mm<sup>2</sup> °C
- a viscosity ratio  $k=2$ .

The viscosity ratio k is the ratio of the actual viscosity at the operating temperature to the requisite viscosity for a proper lubrication at that temperature. Further details can be found in subchapter "Adjusted rating life", life adjustment factor  $a_{23}$  - on page 21.

In case of grease lubrication, the base oil viscosity of the grease should be used. These effects can be reduced at low speeds by using oils with EP additives.

Factors $k_1$ and $k_2$ <span style="float: right;">Table 5</span>		
Factor	Lubrication	
	oil	grease
<b>Bearings construction E</b>		
$k_1$	1,5	1
$k_2$	0,15	0,1
<b>Other bearings</b>		
$k_1$	0,5	0,3
$k_2$	0,05	0,03

The values of permissible axial load  $F_{a\max}$  obtained from the equation above mentioned are valid for a continuously acting constant axial load. If axial loads act only for short periods, the values may be multiplied by 2 or for shock loads by 3.

The constantly acting axial load  $F_{a\max}$  (N) should never exceed the numerical value of  $1,2 D^2$  ( $D$  = bearing outside diameter, mm) and occasional shock loads should never be greater than the numerical value of  $3D^2$ .

In case of heavy axial loads ( $F_a > D^2$ ), the ribs of the outer and inner ring respectively are recommended to be supported by the bearing ad joint parts. Bearings of NUP and NJ+HJ designs which take axial loads in both directions are to be placed so that main axial loads should be taken by fixed ribs, if bearing design allows.

## Heat treatment

Cylindrical roller bearings with outside diameter  $D > 240$  mm of all series given in the catalogue are to be subject to a heat treatment of stress relieving which allows bearings to be operated up to a temperature of  $+150^\circ\text{C}$ .

The hardness of rigs should not be less 59 HRC.

Small-sized bearings operate normally up to  $+120^\circ\text{C}$ .

## Abutment dimensions

For a proper location of bearing rings on the shaft and housing shoulder respectively, shaft (housing) maximum radius  $r_{u\max}$  should be less than bearing minimum mounting chamfer  $r_{s\min}$ .

Shoulder height should also be properly sized in case of bearing maximum mounting chamfer.

The values of the connection radius and support shoulder height are given in table 6.

Abutment dimensions for single row cylindrical roller bearings are given in table 7. The values for double row cylindrical roller bearings are given in table 8.

# Double Row Cylindrical Roller Bearings

## Standards, Boundary dimensions

Standard plans                   DIN 616  
 Double row cylindrical roller bearings,  
   DIN 5412 / part 4

## General

Double Row Cylindrical Roller Bearings of series NN30 and NNU 49 are separable radial bearings.

They are frequently used as non – locating bearings arrangements of working spindles for machine tools. Therefore, these bearings are often used in high precision tolerance class, frequently in combination with reduced internal clearance. These bearings also feature high radial load capacity and are satisfactory for high speed applications, providing a very stiff and rigid bearing arrangement. They are also commonly used with tapered bores, namely suffix K, (i.e. taper 1:12).

## Design variants of Double Row Cylindrical Roller Bearings

Double Row Cylindrical Roller Bearings of series NN 30.. and NNU 49.. are produced and available either with or without tapered bores, as standard (see also figure below).

Bearings of series NN 30.. comprise of a plain outer ring and an inner ring with three integral shoulders to guide the two separate rows of rollers around the raceway. These bearings series are produced with lubrication facilities in their outer ring, such as a circumferential lubrication groove and holes as standard, name suffix W33.

Unlike the NN30.. series the double row cylindrical roller bearings of the NNU 49.. series feature opposite internal design characteristics, (i.e. outer ring with 3 integral shoulders around the raceway and a plain inner ring). These bearing series also feature lubrication facilities in their outer ring as standard, also namely, suffix W33.

NN30..W33

NN30..K..W33

NNU49..W33

NNU49..K..W33

Cylindrical roller bearings of series NN30.. and NNU49.. allow for compensation of length changes within the bearings itself. In this way they are ideal non-locating bearings.

Both bearing rings may be mounted with heavy interference fit to shaft and housing.

## Misalignment

Double Row Cylindrical Roller bearings are not able to accommodate misalignments.

## Tolerances

**Double Row Cylindrical Roller Bearings of series NN 30.. and NNU 49..** are frequently used as spindle bearings.

Consequently, they are also available with closer tolerance classes, such as P4 or SP, as standard.

On request these bearings are also produced to other tolerance classes.

Detailed tolerance values, for URB double row cylindrical roller bearings and URB double row cylindrical roller bearings in spindle bearing design, tolerance class SP, are listed in the table shown in the chapter "Bearing tolerances" page 25.

## Cages

URB Double Row Cylindrical Roller Bearings of the series NN 30.. and NNU 49.. are produced with roller riding solid brass cages as standard.

## Internal clearance

**URB Double Row Cylindrical Roller Bearings** are produced with normal internal clearance (clearance group CN, historically designated C0) as standard. Other internal radial clearances are produced upon order request.

### NOTE:

### URB Double Row Cylindrical Roller Bearings

of series NN 30.. and NNU 49.. produced to high precision design are frequently used with reduced internal radial clearance (clearance group C1).

As these bearings are produced to very closed tolerances, under no circumstances should components be mixed or exchanged with other bearing parts.

The value of internal clearance groups of URB Cylindrical Roller Bearings are listed in the tables on pages 155-156.

These Values conform, as far as they are standardised, and conform to DIN 620/part 4 and ISO 5753-1, respectively.

## Minimum load

The minimum load applied to fast rotating double row cylindrical roller bearings should be higher than 4 % of its dynamic load rating  $C_r$ .

## Equivalent Dynamic bearing load

Since double Row Cylindrical Roller Bearings of series NN 30.. and NNU 49.. are non – locating bearings, they are not able to accommodate any thrust loads.

$$P = F_r$$

## Equivalent static bearing load

For Single and Double row cylindrical roller bearings:

$$P_0 = F_r$$

## Mounting

When handling High Precision double row cylindrical roller bearings particular attention must be paid to the relevant instructions of fitting and mounting of these bearings.

When double row cylindrical roller bearings, with

tapered inner bores, are mounted the effect on the running clearance can be adjusted to obtain a specific clearance or preload.

As these bearing types are separable under no circumstances should either components or assembled bearings be mixed or exchanged with other bearing parts.

### Abutment and fillet dimensions for Double row cylindrical roller bearings

The bearing rings must only contact adjacent parts with their side faces. The bearing corners must not touch the corner fillet radii or either the shaft or housing corners.

Therefore, the largest fillet radius ( $r_g$ ) must be smaller than the minimum fillet dimension of the bearings rings ( $r_s$ ) as listed in the bearing tables, also see next page.

Recommendations for the dimensions of adjacent parts are listed in **DIN 5418**.

### Abutment and fillet dimensions for Double Row Cylindrical Roller Bearings

Dimensions are in [mm]

## RIGHT-ANGLE CHQ

The right-angle gear drives of the CHQ series were designed for industrial applications, where it is necessary to transmit rotary power motion between axes arranged perpendicularly.

Eight different sizes, five gear ratios (or speed multipliers) 1:1 - 1:1.5 - 1:2 - 1:3 - 1:4, shafts with diameters ranging from 11 to 85 mm, through hollow shafts with diameters from 12 to 80 mm with splines from 4 to 22 mm, or hollow shafts with UNI 8953 NT grooved profile from 6x11x14 to 10x72x82.

Also available are hollow shafts set-up for driving with locking set, and flanges with hollow shaft and spline seat for electric motor coupling in B5 and B14 versions, size from 86 to 160.

Powers up to 1,074 kW, torques up to 9,516 Nm, rotation speed up to 3,000 rpm and even faster.

## SPECIAL COMPONENTS MANUFACTURING

We produce high precision Gears and Special Mechanical Components.

A large and varied range of modern CNC machine tools assures large capacity production at high quality level.

Chiaravalli Group SpA co-workers, highly skilful and motivated by a great spirit of

belonging to the company, operate using the most modern CAE and CAD-CAM technologies. The production is certified and assured using three-dimensional high precision measuring machines.

Chiaravalli Group SpA your technological partner for high quality production.

Cylindrical roller bearings

## TAPERED ROLLER BEARINGS

# Tapered roller bearings

Tapered roller bearings have the rolling elements under the form of a frustum of a cone.

They roll on tapered surfaces which, if it's extended, converge towards a single point on the bearing axis.

The rollers are guided tangentially by the cage and axially by the big rib of the outer ring, on which they have point contact. As between roller and raceways there is linear contact, tapered roller bearings can take heavy radial loads. They can also take heavy axial or combined loads, depending on the contact angle caused by the tapered rolling elements. The

contact angle is the angle of the outer raceway generatrix.

Constructive versions for single row tapered roller bearings:

- single row

## Suffixes

- A** - increased basic load
- B** - enlarged contact angle
- F** - machined cage of hardened steel or special cast iron
- F2** - constructive modifications
- J** - pressed cage of not hardened steel sheet
- K** - tapered bore 1:12
- M** - machined brass cage

- P6X** - tolerance class with smaller values than normal
- P5** - tolerance class with smaller values than P6X
- P4** - tolerance class with smaller values than P5
- P2** - tolerance class with smaller values than P4
- R** - rib on the outer ring
- S0** - operating temperature up to +150°C
- S1** - operating temperature up to +200°C
- TN** - polyamide cage
- X** - modified main dimensions according to ISO

## Single row tapered roller bearings

Single row tapered roller bearings are of separable design, i.e. the outer ring and the inner ring with rollers and cage assembly can be separately mounted. These two assemblies are interchangeable.

Tapered roller bearings can be manufactured both in standardized constructive versions with dimensions series 320, 302, 322, 303, 323, 313 and with non-standardized dimensions, mm or inch.

Tapered roller bearings can carry only single direction axial loads. Under pure radial loads, an axial force occurs which is supposed to distance the bearing ring in axial direction.

Therefore, tapered roller bearings are generally pair mounted on both ends of the shaft, in "X" or "O"

arrangements, so that the shaft will be axially located in both directions (table 3). Thus, the optimum clearance in these two bearings can be adjusted.

Single row tapered roller bearings can also be manufactured with rib on the outer ring. This design is to be used when the housing cannot be manufactured with shoulder, but only with a passed through bore. In this case, axial location can be provided by the bearing ring.

Permissible values of misalignment between shaft and housing are given in table 1, depending on bearing size and load magnitude.

## Tolerances

Tapered roller bearings are generally manufactured

Permissible misalignment <span style="float: right;">Table 1</span>		
Bearings series	Load magnitude	Permissible misalignment
<b>329, 320, 330, 331, 302, 322, 332, 313, 303</b>	$F_r/C_{Or} < 0,1$ $F_r/C_{Or} > 0,1$	2' 4'
<b>323</b>	$F_r/C_{Or} < 0,1$ $F_r/C_{Or} > 0,1$	1'30" 3'

to the normal tolerance class ISO and AFBMA, respectively (for bearings with inch dimensions).

For certain applications (e.g. bearings for machine-tools), they can be also manufactured to tolerance classes P5 and P6X or 3 AFBMA.

At request, they can be manufactured to tolerance class P4.

Single row tapered roller bearings have the outer rings interchangeable with the inner ring - rollers - cage assembly (if they have the same mark) and also with bearings produced by other companies, according to ISO and AFBMA respectively.

The tolerances for bearings overall dimensions are given in tables on the pages 34-38 for tapered roller bearings, both with metric and inch dimensions. Tolerances for mounting chamfer are given in tables on page 42.

## Cages

Small and medium-sized tapered roller bearings are generally fitted with pressed sheet cages. Large

sized bearings are generally fitted with machined steel or brass cages, with welded pins. In some cases, median or large sized bearings can also be fitted with machined steel or brass cages. In all cases, the cage is guided on rollers.

For small and medium sized bearings, glass fibre reinforced polyamide 6.6 cages can be successfully used if the operating temperature doesn't exceed +120°C. They have low mass, are noiseless in operation and have low coefficient of friction.

Design and some technical data are given in table 2.

## Equivalent dynamic radial load

Equivalent dynamic radial load can be calculated using the following equations:

$$P_r = F_r, \text{ kN}, \quad \text{when } F_a/F_r \leq e$$

$$P_r = 0,4 F_r + YF_a, \text{ kN}, \quad \text{when } F_a/F_r > e$$

F<sub>a</sub> values can be calculated using the equations in table 3.

These equations are available when bearings are mounted so that axial clearance is in fact zero without preloading. F<sub>rA</sub> and F<sub>rB</sub> should always be considered as being positive, even if they act in the opposite direction to that in the figure.

The values of e, Y are given in bearing tables.

Cage design and some technical data <span style="float: right;">Table 2</span>					
Cage	Design		Application	Max. value D <sub>m</sub> n	
	bearing	cage		oil	grease
Pressed sheet cage			- General application - Small and medium sized bearings d ≤ 250 mm	350x10 <sup>3</sup>	245x10 <sup>3</sup>
Machined brass cage M			- General application - Median and large sized bearings d > 150 mm	450x10 <sup>3</sup>	315x10 <sup>3</sup>

## Equivalent static radial load

Equivalent static radial load can be calculated using the equations:

$$P_{0r} = F_r, \text{ kN,} \quad \text{when } F_a/F_r \leq 1/2 Y_0$$

$$P_{0r} = 0,5 F_r + Y_0 F_a, \text{ kN,} \quad \text{when } F_a/F_r > 1/2 Y_0$$

$F_a$  is calculated as in case of equivalent dynamic

radial load. The values of  $Y_0$  are given in bearing tables.

## Abutment dimensions

The mounting dimensions of tapered roller bearings are given in the bearings tables, for single row tapered roller bearings. These dimensions are also available for bearings with ribs.

# Spherical roller bearings

Spherical roller bearings operate in arduous conditions. The spherical rollers can be symmetrical or unsymmetrical and are self-aligning in the outer ring sphered raceway. Thus, the possible coaxiality deviations of the supporting bearings as well as shaft bending can be compensated.

Spherical roller bearings are manufactured in the following constructive versions, depending on the bearing size and series.

## MB design

These bearings have a central fixed rib and machined cages guided on the inner ring rib.

## MA design

These bearings have a central fixed rib and machined cages guided on the outer ring rib.

## C design

These bearings have a central guide rib floating on the inner ring, symmetrical rollers with larger dimensions so that the load carrying capacity increases. Special pressed sheet cage. Bearings of this design are of small and medium sizes.

## CA design

These bearings have side shoulders and an one-piece machined brass cage. They also have symmetrical rollers with larger dimensions so that the load carrying capacity increases. This design is available for medium and large-sized bearings

Other constructive versions are shown below:

Cylindrical bore, lubrication groove and holes in the outer ring

Tapered bore, lubrication groove and holes in the outer ring (taper 1:12, 1:30)

With adapter sleeves

With withdrawal sleeves.

**Suffixes**

- C** - modified inner design, increased basic load, symmetrical rollers, pressed sheet cage.
- CA** - modified inner design, increased basic load, one-piece machined brass cage
- F2, F3** - constructive modifications
- K** - tapered bore bearings, taper 1:12
- K30** - tapered bore bearings, taper 1:30
- MA** - machined brass cage guided on the outer ring
- MB** - machined brass cage guided on the inner ring
- P** - two-piece outer ring
- W33** - lubrication groove and holes in the outer ring

**Tolerances**

Spherical roller bearings with both cylindrical and tapered bore, are manufactured in normal tolerance class (see chapter Bearing tolerance, page 25).

**Radial Clearance**

Spherical roller bearings are generally manufactured with normal radial clearance. At request, they can be manufactured with clearances larger than normal (C3, C4 etc.) or smaller than normal (C2).

The limit values of the radial clearance measured on unloaded bearings are in accordance with SR ISO 5753 and are given in tables 1 and 2.

**Dimensions**

The main dimensions of spherical roller bearings are in accordance with ISO 15 and national standard SR 3918 respectively.

The dimensions of the adapter sleeves are in accordance with national standard SR ISO 2982-1.

The dimensions of the safety washers are in accordance with national standard SR ISO 2982-2.

The dimensions of the bearings nuts are in accordance with national standard SR ISO 2982-2.

The dimensions of the withdrawal sleeves are in accordance with national standard SR ISO 2982-1 and pages 416-437.

## Misalignment

Spherical roller bearings allow angular misalignment between the outer ring and Inner ring without any influence on the bearing rating life. Under normal loads and operating conditions and when the Inner ring rotates, the values of the permissible misalignment depending on the bearing series are given in table 3.

## Cages

Small and medium size spherical roller bearing are fitted with pressed sheet or machined brass cages (Y). Bearings of normal design are fitted with

machined brass or steel cages guided on the rollers (M), inner ring (MB) or outer ring raceway (MA).

Glass fibre reinforced polyamide 6.6 cages are successfully used for small and medium size bearings if the operating temperature doesn't exceed +120°C.

Large-size bearings are fitted with machined brass cages, CA design.

Designs and some technical data are given in table 4.

<b>C design</b> - Floating guiding middle collar on inner ring - Special steel sheet cage - Oversize symmetrical spherical rollers to provide for increased loading capacity - Small and middle size bearings are produced in this version			- General application design - Moderate speeds - Bearings with d < 200 mm	300 x 10 <sup>3</sup>	225 x 10 <sup>3</sup>
<b>MA design</b> - Machined solid brass cage guided on outer ring - Middle standing collar on inner ring - Side flanges on inner ring			- General application - Moderate and high speeds - Bearings with d > 200 mm	400 x 10 <sup>3</sup>	300 x 10 <sup>3</sup>
<b>CA design</b> - One-piece solid brass cage - Side flanges on inner ring - Oversize symmetrical spherical rollers to provide with increased loading capacity - Middle and large size bearings are produced in this version			- General application - Bearings with d > 200 mm	350 x 10 <sup>3</sup>	265 x 10 <sup>3</sup>
<b>MB design</b> - Middle standing collar on inner ring - Machined solid brass cage guided on collar - Side flanges on inner ring - All bearings sizes can be produced in this version			- General application - Bearings with d > 40 mm	350 x 10 <sup>3</sup>	265 x 10 <sup>3</sup>

314

### Lubrication grooves and holes

Spherical roller bearings are provided with a lubrication groove and holes in the outer ring, excepting those of series 213. Designation suffix W33 is used to identify this feature on bearings. The dimensions of the groove, bore diameter and their number depending on the dimension series are given in table 5.

### Axial load for bearings mounted on adapter sleeves

If the spherical roller bearings are mounted on a smooth shaft using an adapter sleeve, without side support, the axial load carrying capacity depends on the friction between shaft and sleeve.

Considering that the mounting is correctly done, the permissible axial load can be accurately enough determined using the following equation

$$F_{a \max} = 3 * B * d, \text{ KN}$$

where:

$F_{a \max}$  - maximum permissible axial load, KN;

B - bearing width, mm;

d - bearing bore diameter, mm.

Dimensions of lubrication grooves and holes

### Equivalent dynamic radial load

$$P_r = F_r + Y_1 F_a, \text{ kN, for } F_a/F_r < e$$

$$P_r = 67 F_r + Y_2 F_a, \text{ kN, for } F_a/F_r > e$$

The values of the factors depending on the bearing type can be found in bearing tables.

### Equivalent static radial load

$$P_{0r} = F_r + Y_0 * F_a, \text{ KN}$$

The value of the factor  $Y_0$  depending on the bearing type can be found in bearing tables.

### Abutment dimensions

For a proper location of bearing rings on the shaft and housing shoulder respectively, shaft (housing) maximum connection radius  $r_{u \text{ max}}$  should be less than bearing minimum mounting chamfer  $r_{s \text{ min}}$ .

Shoulder height should also be properly sized in case of bearing maximum mounting chamfer.

The values of the connection radii and support shoulder height are given in table. The mounting dimensions for bearings with withdrawal sleeves are given in table 6.

## WORM SCREW JACKS

The new line of Worm Screw Jacks named CHT (Chiaravalli High Tech) integrates and completes our range of Mechanical Transmission products.

This new line of products is manufactured using high quality materials, manufactured with absolute precision, making use of the modern machinery fleet of the companies belonging to Chiaravalli Group SpA.

The basic elements that make up the final product "Screw Jack" are made in large series, rigorously checked and put in stock.

Special virtual software developed by Chiaravalli Group SpA enables our customers to first view the various elements of the required screw jack and then, in the second phase, to order it with absolute precision and confidence.

Chiaravalli Group SpA is engaged to ensure the delivery of this product in very short time, with quality and precision.

## THRUST BALL BEARINGS

# Thrust Ball Bearings

## Standards, Boundary dimensions

Standard plans	DIN 616
Thrust ball bearings single direction	DIN 711
Thrust ball bearings double direction	DIN 715
Seating washers	DIN 711

## General

Thrust Ball Bearings are separable axial bearings that are produced in both single and double direction acting design. To assist in simple effective mounting or dismounting the bearing washers, seating's, and cage and ball assemblies, may be individually mounted in their arrangement location.

Thrust ball bearings may accommodate comparatively high axial loads but they must not be exposed to any radial forces.

Due to their specific kinematic behavior, thrust ball bearings are only suitable for low to medium operating speeds.

Furthermore, they require minimum axial loads for their optimum function. Since thrust ball bearings do not compensate any misalignment, they are also frequently used in conjunction with sphered housing washers and seating washers.

## Design variants (see drawing on next page)

**Thrust ball bearings** are produced in both, single direction and double direction design. The most important design variants are shown on the next page.

**Single direction thrust ball bearings** consist of a **shaft washer**, a **housing washer** and a **ball and cage thrust assembly** (see figure a, b and c).

These bearings are able to accommodate axial loads in one direction only.

**Single direction thrust ball bearings** of series **511**, **512**, **513** and **514** have plain housing washers, (see figure a).

For applications where some misalignment may occur, single direction thrust ball bearings of the series **532**, **533** and **534** are also available with sphered housing washers, figure b.

These bearings may be applied either direct to sphered shaped bearings seats or, they may be used together with **seating washers** of series **U2**, **U3** or **U4** (see figure c).

Unlike single direction thrust ball bearing types, **double direction thrust ball bearings** are suitable to guide the shaft in both directions (see figure d, e and f).

These bearings consist of two washers, **two balls and cage thrust assemblies** with one common **shaft washer** located centrally in between.

Double direction thrust ball bearings are also available in both designs, with **at housing washers** (series **522**, **523** and **524** figure d) and with sphered housing washers (series **542**, **543** and **544** figure e).

For compensation of possible aligning errors the double direction thrust ball bearings may be used in conjunction with **Seating Washers** (series **U2**, **U3** and **U4**, see figure f).

c

440

d

e

f

## Misalignment

**All thrust ball bearings with flat housing washers do not allow any misalignment.**

The contacting surfaces of both shaft and housing seats must be parallel. Misalignments can only be accommodated by using Thrust Ball bearings with **sphered housing washers**.

## Cages

**URB** thrust ball bearings are normally fitted with pressed steel cages as standard.

For larger thrust ball bearings solid brass cages (suffix **M**), or solid steel cages (suffix **F**), are fitted as standard.

## Tolerances

**URB** thrust ball bearings are produced to normal class tolerance class (**PN**) as standard.

For applications of higher dimensional and geometrical accuracy these bearings are produced to precision tolerance class (e.g. **P6**) on order request.

For detailed values of the tolerance classes see chapter **Bearing tolerances** (see page 39-40).

## Minimum load:

Thrust ball bearings require a certain minimum axial load to ensure a satisfactory operating function.

To prevent excessive sliding friction, the minimum axial load applied should be greater than **4%** of the axial bearing dynamic load rating **Ca**.

Where such a minimum axial load is not possible, the load must be increased by effective measures, (i.e. preloading the bearing) using pressure washers or springs.

## Equivalent dynamic bearing load

Thrust ball bearings are pure axial bearings, there are not able to accommodate any radial loads, therefore:

$$P = F_a$$

## Equivalent static bearing load

For thrust ball bearings:

$$P_0 = F_a$$

## Abutment and Fillet dimensions for thrust ball bearings

The bearing washer must contact adjacent parts with their face sides only. The radii of bearing shoulder fillet radii of the shaft or housing shoulders.

Therefore fillet radius ( $r_g$ ) must be smaller than the minimum fillet dimension of the bearing rings ( $r_s$ ) as listed in the bearing tables.

## PLANETARY GEARBOX

High reliability, compact volumes and easy construction are among the main characteristics of new CHIARAVALLI planetary gearboxes.

As one of the main advantages, our planetary gearboxes can be easily assembled with electric and hydraulic motors, worm gearboxes (CHM series) and input shafts.

Furthermore, they can be assembled with different output flanges or shafts, all these characteristics make them suitable for several industrial applications.

CHIARAVALLI planetary gear boxes are available in linear version (CHPL) and

angular one (CHPLB). Our range covers 11 transmission sizes, from 100 daNm up to 3500 daNm, rate reductions from 3.55:1 to 3422:1 and more with four reduction stages (these available upon request).

CHIARAVALLI planetary gearboxes are available at anti rusted treated blank surface ready to be painted.

**CAST IRON SERIES GEARBOXES CH-G**

482

**1) ORDERS** - Orders for special and standard material must always refer to offers made by CHIARAVALLI GROUP SpA. The orders are binding for the client. Once work has commenced no cancellations or order reductions will be accepted unless the client reimburses the costs of the material and the work carried out up to the moment in which the order was suspended. The quantity despatched can vary by  $\pm 5\%$  compared to the quantity ordered.

**2) PRICES** - The prices are those in force at the date of order. All prices are for goods delivered ex-works Premezzo, packing excluded. If there should be any increase in production and material costs over the duration of the supply, CHIARAVALLI GROUP SpA reserves the right to adapt the prices accordingly, even for orders in course.

**3) TERMS OF DELIVERY** - Only the terms of delivery indicated by CHIARAVALLI GROUP SpA are to be considered valid. However, they must only be considered as indicative. In the event of difficulty in the procurement of materials, strikes or in any event in all cases of force majeure, the terms of delivery will be automatically extended without CHIARAVALLI GROUP SpA having to pay any reimbursement for damages. The client is obligated to collect special material ordered when ready.

**4) DELIVERIES** - Deliveries are the responsibility of the purchaser and are carried out at his own risk and peril. Any claims for shortages must be presented within 8 days of receipt of the goods. If it is agreed that the cost of transport is to be paid, even if only in part, by CHIARAVALLI GROUP SpA, the latter reserves the right to choose the most economical means of transport.

**5) PACKING** - Packing will be invoiced at cost.

**6) RETURNS** - No returns for any reason will be accepted unless previously authorised and with packing, any customs clearance and the return paid for by the purchaser. To cover warehouse and administrative expenses a debit note will be issued for approx. 15% of the value of the goods returned.

**7) WARRANTY** - CHIARAVALLI GROUP SpA promises to repair or substitute free of charge any parts that they recognise as being defective. The questioned goods must be returned to the factory of CHIARAVALLI GROUP SpA, free of all expenses. The warranty will be considered cancelled in the event that the parts returned as defective have been repaired or tampered with. The repair of defective parts carried out by the purchaser will only be accepted after authorisation from CHIARAVALLI GROUP SpA and after their approval of the cost estimate. CHIARAVALLI GROUP SpA does not accept responsibility or pay any reimbursement for damages that occur during the use of their products, even if defective. Warranty is excluded for leakage of lubricant caused by wear of the oil seals.

**8) RESPONSIBILITY** - CHIARAVALLI GROUP SpA does not accept responsibility or pay any reimbursement for damages that occur during the use of their products, even if defective. CHIARAVALLI GROUP SpA declines all responsibility in the execution of parts to a client's design under any patents.

**9) PAYMENTS** - Only payments carried out in the manner and terms agreed will be considered valid. Once the due date of payment has passed, CHIARAVALLI GROUP SpA will calculate the interest on delayed payment at a rate that is 3% higher than the legal one, retaining the right to demand payment. In the event of delayed or missing payment by the purchaser, the company CHIARAVALLI GROUP SpA reserves the right to suspend deliveries of the orders in course or to demand advance payment without having to pay any reimbursement or compensation to the purchaser. Any dispute regarding materials in manufacture or already possessed by the purchaser does not free the latter from the commitment of making the payment by the agreed date and for the whole amount of the invoice without making any deductions.

**10) OWNERSHIP** - All of the goods despatched remain the property of CHIARAVALLI GROUP SpA until the invoice is fully paid.

**11) COMPETENT COURT** - Any controversy concerning business relations with CHIARAVALLI GROUP SpA will be dealt with under the jurisdiction of the Court of Busto Arsizio. Chiaravalli Group SpA accepts no responsibility for any errors in the production of this catalogue and reserves the right to add to the designs or dimensions of the listed products any modification called for by manufacturing requirements or due to evolution of the product.

*"I poured my soul into the work  
and the work has traced the path of my life  
and to the lives of many of my associates"*
